

# ARDF organizer FjwW

The program **FjwW** is used for the result evaluation of [ARDF](#) competitions with

**SportIdent**® system from AES Arnstadt  
[www.sportident.com](http://www.sportident.com)

This help in [German](#)  or [French](#) 

Translator: Jens - DL8KAN (Karl-Heinz - DL7VDB)

**Hints to improve this English text are welcome !**

In an [ARDF](#) competition the competitor carries a special chip which is used to register the arrival times at the transmitters and the finish. The times are stored on the chip and in the timekeeping devices (stations). The program **FjwW** enables the user to read the registered times and make a lot of different analysis of the results for one or more competitions.

**©Copyright** FjwW is **not freeware** and requires on **each PC**, a licence key which is unique for a given PC or/and a specific SI chip. The licence key can be obtained from the [author of the program](#). Without a valid licence key the program runs in a demo version with restricted features.

**Concerning [anomalies](#) of this FjwW-Unicode version comparatively to predecessor [see](#) .**

Description of the installation [see](#) .

Description of the licensing [see](#) .

Informations concerning ARDF-FjwW, versions, current Name Lists, ... can be find on [www.dl7vdb.de](http://www.dl7vdb.de) or [www.ARDF-FjwW.com](http://www.ARDF-FjwW.com).

List of supported **SportIdent** devices and chip cards [see](#) .

To run FjwW for ARDF competitions you need at least the following files, when all variants of languages are installed:

<b>FjwW.exe</b>	Program itself
<b>FjwE.cmd</b>	Command file for start FjwW editor separately
<b>FjwW.ini</b>	INI file which contains the settings, since V9.12 as UTF16 format! however, old INI file in the ANSI format is further usable (when [RatingRUS] without meaning)
<b>FjwWenu.dll</b>	DLL for the English version of FjwW
<b>FjwWfra.dll</b>	DLL for the French version
<b>FjwWnld.dll</b>	DLL for the Dutch version
<b>FjwWcsy.dll</b>	DLL for the Czech version
<b>FjwWrus.dll</b>	DLL for the Russian version
<b>FjwWplk.dll</b>	DLL for the Polish version
<b>FjwWara.dll</b>	DLL for the German Orienteering version
<b>FjwWcht.dll</b>	DLL for the English Orienteering version
<b>FjwWenu.chm</b>	Help in English
<b>FjwWdeu.chm</b>	Help in German
<b>FjwWfra.chm</b>	<del>Help in French (not completely translated)</del>
<b>FjwWdispl.exe</b>	Windows program to display the results (remotely)
<b>FjwMap.exe</b>	Program to plan positions of transmitters on ARDF competitions and to get simple and quickly the coordinates of positions in FjwW display of GPX/TCX tracks
<b>FjwLay.exe</b>	Program to series printing of certificates
<b>EDADcheck.exe</b>	Program to check the EDAD files
<b>FjwTconv.exe</b>	Program for well-directed correction of time stamps in KOR/DAT files
<b>DCFGPSvdb.exe</b>	DCF/GPS synchronization program, to calibrate PC clock
<b>ZyklCopy.exe</b>	Program for cyclic backup of TLN/KOR files or

	independent using
<b>reduceGPX.cmd</b>	Tools to reduce the GPX file size of the
<b>reduceGPX.txt,</b>	coordinate/time/altitude data required for use in
<b>sed.exe</b>	<b>FjwMap</b>
<b>NameList?.txt</b>	Two extensive list of ARDF competitors (German + international competitors)
Directory	Examples of different TLN, KOR, RTF, XLS, BMP,
<b>Examples</b>	GIF, JPG, LBL, CSV, HTM files
Directory <b>CSS</b>	Examples of different CSS layouts, optionally suppliable by the user in this files

### Installation of FjwW

FjwW is delivered with a installable file called **Setup-FjwW-?.?.?.exe**. After starting the installation follow the instructions. The chosen language (English, German, French) is the preferred language to start FjwW. Not installed components may also be added subsequently. If a newer version is installed into the existing directory of a previous version of FjwW the files **NameList1.txt, NameList2.txt, FjwW.ini** and **FjwW\_TTSdeu.txt** will be renamed to **NameList1.txt.???, NameList2.txt.???, FjwW.ini.??? and FjwW\_TTSdeu.txt.???** to prevent the loss of special settings made by the user. ??? is a number >= 001.

During the first start of FjwW user must enter a licence key; without a valid licence key the program only starts in a demo mode (restricted features).

### **Extras|Associates with FjwW** [see](#)

Sets all links to the version of FjwW actually used (this is necessary of you (re-)use an elder version or you reinstall another version of FjwW).

Should be used SI stations with USB interface, a special USB driver have to install! This driver can be download from [Homepage of AES](#)

## Licensing of FjwW

After the start of FjwW a **PCid** is displayed, which is a string unique to each PC. Please send this PCid to the [author](#) so you can get a valid licence key. Beside and in addition to the licensing to a special PC the licence can also be linked to a SI chip. If you want to use this possibility, you have to send the number of the concerned SI chip to the author as well.

When you receive the licence key, just enter it in the corresponding field and press **Accept**.

On any other PC connect a running SportIdent reading station to a COM port of the PC (COM 1...99), activate **SI chip licence** and press **Accept**. When the program request it, you've to insert the SI chip for which the licence key was created.

Without entered valid licence key the program only starts in a demo mode without some features.

### Remark:

Using the SI chip licensing the SI chip has to be used for each start of the program. Using the licence key it must only be entered at the first start of the program. On any further starting of the program the field can stay empty.

When licensing with SI chip all available COM ports will be scanned for working SI read station. If problems occur, it's possible to start FjwW with parameter "/p?" (? = port number).

If the reading station is in **Autosend** mode [see](#) , you may have to wait for about 20 seconds in error case, when the SI licensing chip must punching repeatedly.

Start the program

**FjwW** can be started as any other Windows program by a double click on the program icon or pressing **ENTER**. Additionally FjwW can

be started by:

- Drag&Drop one or more icons of TLN / EDA file(s) on the FjwW icon or main window or competition data window of FjwW.
- Start FjwW via a command line or a batch file  
**FjwW.exe [/i xyz.ini] 1.tln [2.tln] [3.eda] ....**  
Even wildcards are supported (\*, ?): **FjwW \*.tln** (this does only make sense with TLN files!)  
FjwW.exe can be started from every path, because the environment variable **PATH** is set to path of FjwW.  
After the TLN file the related KOR and DAT files can be declared.
- Shortcut **Ctrl+Alt+F** start program simple and quickly;  
Shortcut **Ctrl+R** loads last TLN file immediately.

When using **Extras|Associates with FjwW** the following links to FjwW are created:

- A link to FjwW in the start menu
- A link to FjwW within the 'send to' part of the context menu (right click) for TLN / KOR / DAT and EDA files.

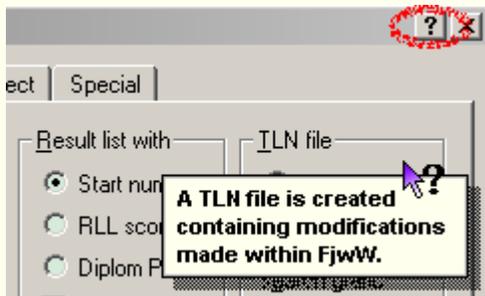

When using the **Send to/ARDF-FjwW** option in the context menu of a file the following actions are executed depending on the file extension:

- TLN/EDA file: If FjwW is not yet running it is started and the file is added as a competition.
- KOR/DAT file: Is added to the actual competition within FjwW.

**FjwW** is available in seven languages (German, English, French, Dutch, Czech, Russian and Polish). The language can be set via **Extras|Language** . German is always available, the other only if the language support was selected when FjwW was installed.

### The help

To display the help of **FjwW** the **F1** key can be pressed at any time.

The help can also be reached via the **Help** menu in the main window. Furthermore the question mark **?** can be used where it's available. The question mark offers context sensitive help for various elements of the application. A click on the questions

mark in the menu bar and after this a click on the element of interest leads to the related help (see example on the left side). If the element to be explained already has the focus or the cursor is within the field to be explained, **Shift+F1** leads to the context sensitive help as well.

## Support for error corrections

If FjwW does not end properly (crashes) it creates two files in the subdirectory **LOG** which are called **~FjwWcrash.txt** and **~FjwWcrash.dmp**. Please send these files and the log file **~FjwW.log** to the [author](#) (for example via the menu **Help|Bug Report**). It's also helpful if a description of the circumstances of the crash is described and the TLN-/KOR-/DAT-/LOG files are added (preferable in a ZIP archive). This will help to accelerate the correction of errors. After transfer the files they can be deleted.

## Particularities of versions since 19.8

In order to better process the timestamps read by SI-Chip5, there is a change since version 19.8. In the KOR file, the timestamps read from the SIchip5 are stored unchanged, there are only timestamps from **0:00:00** to **11:59:59**. This Chip5 type can only store 12-hour timestamps due to the limited memory space (two bytes per timestamp). Only when re-reading a competition (first TLN then KOR file) are the timestamps according to the competition data (Begin-End Time) converted and evaluated. Thus, changes in competition data always result in a correct evaluation, so this option is preferable.

Since the time stamps from the KOR file as of V19.8 are processed differently, they must be identified in the associated TLN file with a new keyword line: **@VERSION: 1908**

For a new contest created in FjwW (menu **File / New competition Ctrl+N**) this keyword will be automatically entered. If the contest is created by a self-created/copied/modified TLN file, it must be inserted. If SIchip5 data already exists in the KOR file, it must not be entered later. Then the advantages that result from the other storage in the KOR file can be used.

The SI-Chip5 can be used without any problem in the 12 hours after the start of the competition, even in midnight two-day competitions. If this is not the case, the timestamps read from the chip must be manually corrected (by 12/24/36 hours). If the time is on the following day, the time must be supplemented with a letter "a", e.g. **10:12:34a**).

-----

## Particularities of the unicode version

FjwW-Unicode is able to display all international (special) characters as Cyrillic, Arabian, Korean, Eastern- and Northern European countries. These option requieres that the needed fonts are installed

within Windows (specially for Korean/Japanese/Chinese...). Internally FjwW uses UTF-16 codifications (two bytes per character). The files and lists created by FjwW are stored in UTF-8 format (one to four bytes per character). Because of this change in the file format the files can NOT be read by older versions of FjwW (V7.10 and below).

It is possible to convert the UTF-8 files to ANSI (character set 1252 = Windows ANSI) by using FjwW-Unicode (\*) or other Windows programs (\*\*).

If FjwW-Unicode is used to open TLN/KOR/DAT files in the ANSI format of older versions of FjwW the data of the competition or of the competitors can not be modified at all. You can only print (result) lists. If data has to be modified the ANSI files must to be converted into UTF-8 files prior to open them with FjwW-Unicode. The conversion can be done with FjwW Unicode (\*) or other Windows programs (\*\*).

(\*) Converting the files from unicode to ANSI and vice versa is possible with the integrated editor of FjwW-Unicode. Use **File|File display edit CTRL+E** . Using **File|Save as** the required file format can be chosen.

(\*\*) Windows programs which can be used to display, edit and convert UTF-8 files are: **MS Editor (NOTEPAD.EXE)**, **MS-Word** and others. Just check the file formats available when using **File|Save as** .

# The main window of application

The screenshot shows the main window of the ARDF organizer application. The title bar reads "ARDF organizer". The menu bar includes "File", "Edit", "Results", "Interface", "Extras", "View", and "Help". Below the menu bar is a toolbar with various icons. The main area contains a table with the following data:

StNo	PI	Name	Club	Call	Run ti...	Fo	Start	Finish	Chip No	Sequence	Cat	Birth	Status	GRP
7	1.	Van Britsom, Marc	BEL	ON4FOX	57'02	5	10:25	11:22:02	43705	S-2-4-5-3-1-F	M50	1966		BEL
2	2.	Daverveld, Marcel	NED	PE5TT	61'41	5	10:15	11:16:41	2096717	S-2-1-5-3-4-F	M50	1965	PM	
11	3.	Eichler, Gerald	Z21	DL1DSR	64'30	5	10:15	11:19:30	411769	S-2-3-1-5-4-F	M50	1966	PM	
23	4.	Pohl, Walter	G10	DL5KCS	73'18	5	10:30	11:43:18	362809	S-2-3-1-5-4-F	M50	1963	PM	
4	5.	Plantagie, Benno	NED	PA3FBX	76'55	5	10:20	11:36:55	2045553	S-1-5-3-2-4-F	M50	1964		

At the bottom of the window, there is a status bar showing "[1] of 1", "M50=5", and "Classic 2-m-ARDF-Wedstrijd, Maasmechelen, Belgie."

## Tool bar

- Select box to select the file name of the TLN-File to be displayed in the result list table of the actual competition. By pressing **Ctrl+Cursor down** or **Ctrl+Cursor up** the next or the previous competition can be selected as well.
- Icons to select the result list of the available categories. **Ctrl+F1 . . . Ctrl+F10** can be used to change the categories. Using **Ctrl+Cursor right** and **Ctrl+Cursor left** moves through the categories.
- Icons to change the order of the categories. The order of the icons is also used for the display of the result lists and for the sending to the DisplayPCs which show the result lists. The icons are only visible if changes can be made to the order of categories.
- Icons to select the competitors not yet arrived **Ctrl+A** or already having finished **Ctrl+Z**.
- Icon **Ctrl+Q** to display the SI chip number with which no participant is registered in the competition. Occurs when reading the chip data during a competition or when registering

participants by reading the chip and not being accepted into the competition.

- Icon (**Ctrl+H**) displaying the Helper
- Icon (**Ctrl+C**) for display the no active participants/helpers stored in the deposit.
- Icon (**Ctrl+S**) to save the data to the TLN file
- Icon (**Ctrl+F**) for a quick search for name, call, club, searching order, start number, card number birth year

## Header of the result list

StNo	PI	Name	Club	Call	Run time	Fo	Start	Finish	Chip No	Sequence	Cat	Birth	Status	GRP	R
------	----	------	------	------	----------	----	-------	--------	---------	----------	-----	-------	--------	-----	---

The abbreviations have the following meaning:

- **PI** = Place, Place number or abbreviations OVT, NOF, SPW, DSQ [see](#) 
  - **Fo** = Number of transmitters, asterisk **\*** before mean, the value is set manually, the equals sign **=** the value is reduced by calculation a wrong route during a Sprint competition.
  - **Bonus** = Bonus (Credit) for Run time in minutes.
  - **Chip No** = SI chip number. Cards marked as lend are marked with an asterisk **\***.
  - **Sequence** = Start-Transmitters-Finish are displayed separated by a hyphen. Other characters indicate, that the transmitter is not taken into account:
    - \*** Transmitter was found but is not taken into account because it's not in the list of transmitters to be found by this category.
    - #** Transmitter was found/punched more than one with a time difference > 1 minute
    - +** The timestamp is out of the range of the start and finish time (must be checked)
    - ?** Timestamp is not valid (must be checked)
    - !** If it comes after the fox number, it means 'Mandatory fox', during the SPRINT it shows the spectator fox
- When a finish beacon exist and the beacon was not registered direct before the finish or the order given by the 'mandatory fox'

has not been adhered to, the sequence will be red in the background (e.g. **S-1-2-3-4-B-5-Z** ).

- **Runtime** = behind a exclamation point (e.g. **65'59 !** ) can be appear, possible only at the day of competition. This means that the placement of this competitor can not be changed. The background will be red (e.g. **-8'01** ) in case of negative value, this means start and finish time are incorrect and have to check/make right.

When the competitor not yet arrived the finish and the run time is over the limit or the Finish-Limit-time is reached, the background of **StNo** and **Runtime** will be yellow (e.g. **99 . . . 133'44** ).

The run time will be blue in the background (e.g. **120'01** ), when the competitor exceed the limit time and will be brown, when the competitor get a bonus to the run time (e.g. **60'01** ).

- **Start** = start time, the start time can be specified in the TLN file, in the participant registration dialog or by balloting. Then they are automatically converted with an entered start delay. This does not happen with manually set start times (in the correction dialog), these start times are then marked **blue** as a hint.
- The **CAT**egory will be yellow in the background (e.g. **M50** ), when the year of **Birth** is given and the competitor not started in the age-right category (concerning the IARU R1 ARDF rules). If other first letters are listed in **[FjwW]** in **MenCatFirstChar=** and **WomenCatFirstChar=** in the INI file, the age-matched IARU categories used for this rating.
- At **StNo** an  appears if the participant does not appear in the result after filtering with the GRP name the GRP name shown.

The width of the columns can be changed by moving the upright separator lines. The order of the columns can be changed by drag&drop. The optimal/necessary width of the columns can be set by menu **Extras|Optimal column width** . The widths of the columns and their order can be saved by **Extras|Save settings** . The settings are stored in the INI file and are restored when the program is started.

Clicking on the headline of a column sorts alphabetically or numerically in ascending order. The next click inverts the order to descending. The third click terminate the sorting; during sorting the complete column will be **blue** in the background. Refreshing the result list by pressing **F5**, **ESC** or via **Extras|Refresh** resets the sorting.

## Result table

🔗 417	1.	Viktor Korshunov	UKR	UT4UXB	61'16	4	10:35	11:36:16	5	2004717	S-3-1-5-B-F	M60
🔗 416	2.	Oleg Fursa	UKR	UR4URL	66'22	4	11:30	12:36:22	5	2004716	S-3-1-5-B-F	M60
🔗 194	3.	Manfred Platzek	GER		67'05	4	10:25	11:32:05	5	2004494	S-3-1-5-B-F	M60

- Display of the results of a category or the finishers list (the latest finisher is on the top) or the list of competitors still running or not started (on the way). The starting groups are optically separated by a blank line. Five minutes before their starting time the competitors are marked with a hook.
- The icon at the left of the start number shows if the competitor will be taken into account in several list defined by **Results|Options of Lists|Group/pFactor** . Changing the hook in the result list doesn't have any meaning.
- When the competition is ongoing those competitors are marked with an exclamation mark where the rank can not be changed by a competitor not yet finished.

A right click in the result list shows a context menu which is the same as the **Edit|...** menu. Pressing key **ESC** deselected the marked line of competitor.

At the day of competition there are a special function in table "competitors not yet finished" (key **Ctrl+A**). When no line is marked, always the next starting competitors will be display visible in the window.

Similar in table "competitors finished" (key **Ctrl+Z**): when no line is marked, always the last arrived competitor will be display in the first, above line.

## Status bar

- Number of the competition which is displayed and total number of opened competitions (ordered by the sequence in which the files were opened).
- Display of the descriptor of the category and the number of competitors in this category.
- Display of the short name of the competition.
- Indicator showing that changes have not been saved.  
 in rotation with  (Modifications have to be saved to the TLN file, for example by **Ctrl+S**)
- Indicator of the existence of a [TLN-BAK-File](#) (including icon)  (Tool tip shows the filename)

# The Competition data window

The competition data window shows the most important data of each competition which is loaded. It allows to change the entries (you must check the box **Edit**).

The window can be hidden by pressing **ESC** and can be found in Systray (taskbar) after that. It can be (re)activated by pressing **Ctrl+F3**.

The select box on the right side allows to select the data of another competition which is loaded. After having changed the data the **Save** button must be pressed. If you uncheck **Edit** before saving all modifications are ignored.

For more help select the question mark at the top right corner of the window and click on the field you want to see the help for.

## Details about the data fields:

- In the uppermost field you can enter up to eight lines to describe the competition. These lines are used as headlines for several lists.
- **Date** can only be changed as long as no data has been read from a KOR or DAT file and no SI chips have been read.
- The **Beacon** has to be found by every competitor. It will be counted as a found transmitter. The fox or beacon number must be lower than the **Fin.No.**
- The **Fox list** contains the number of the transmitters the selected category has to register. Other transmitters are not taken into account for the result list (but they are displayed in some lists). If a competitor is added and his category does not yet exist all previously defined fox numbers are adopted. Fox numbers used for start/finish and the beacon number do not belong in the fox list. If necessary this list must be corrected.

[see](#)  Examples of possibilities of 'Mandatory Fox'.

The starting alley can be placed in front of the fox list. They must be named "A: " through "Z: ".

Those categories without competitors are marked with an asterisk (\*) within the select box. These categories can be delete via  **Delete**

After **Edit** and entered a non existent category into the select box it can be created via **New** .

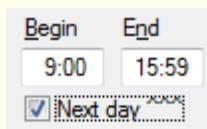

Besides the categories abbreviations the following entries are selectable:

**aK!** not taken into account (out of competition)

**kK!** categories are not considered (no categories)

**allFox** complete list of transmitter numbers

- **Begin** and **End** of the competition have to be set correctly. All start, finish and transmitter times have to be in between these limits to be taken into account. Time stamps that are within these limits are taken as correct time stamps.

Begin	End
9:00	15:59
<input checked="" type="checkbox"/> Next day	

The end may also be the **Next day**, for that activate the checkbox below. Time data of the following day are displayed in different windows, dialogs and lists with an attached **a** (like **a** nother day). [see](#)  Caution: The **SI-Card5** can be used in these competitions for two days only in the first 12 hours (stores only 12-hour time stamps, cannot automatic converted in Two-day time interval) !!! Time stamps which are after the begin but before the start time or after the finish time but before the end time are not correct. They are not taken into account for the result but they are displayed in some lists (these wrong stamps are marked). This method was choose because of the time coding within the SI chips. Using this methods tries to ignore timestamps coming from other competitions if the competitor forgot to erase his/her chip.

- If the **Start dev.** is changed the start times (balloted and start times from TLN file) are recalculated accordingly, but not the start times, which are set manually! The begin and end times

might need to be changed as well (at least check for a valid end time).

- The origin of the start times for each competitor is displayed in **Start time from** and can be changed. The following options are available:

**TLN data** The start times are read from a TLN or KOR file, originate by balloting or manual input.

**TLN + SI Start st. (..sec)** The start times comes from TLN/KOR, overwrite by start times from SI chip/start station second accurate.

**SI Start station (..sec)** The start times are read from a SI start station or the SI chip itself. The time remains second accurate. The start times within the TLN/KOR file are ignored.

**SI Start station (1 min)** The start times are read from a SI start station or the SI chip itself. The time is rounded up to full minutes (0,1,2,..).

**SI Start station (2 min)** The start times are read from a SI start station or the SI chip itself. The time is rounded up to two minutes (0,2,4,..).

**SI Start station (2,5 min)** The start times are read from a SI start station or the SI chip itself. The time is rounded up to two 1/2 minutes (0,2:30,5,..).

**SI Start station (5 min)** The start times are read from a SI start station or the SI chip itself. The time is rounded up to full five minutes (0,5,10,..).

**Fox xx** The timestamp of the selected transmitter is taken as the start time. The timestamp can be provided by the SI chip or the SI station (only for special usage). The fox number may not be in the fox lists of all categories.

- The origin of the finish time for each competitor is displayed in **Finish time from** and can be changed. The following options are available:

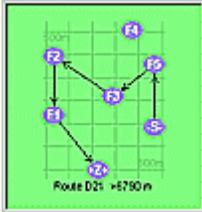

**SI Finish station** The finish times are read from a SI finish station or the SI-chip itself.

**Last Fox or SI finish** The timestamp of the last found transmitter is taken as the finish time. The finish time is the time stamp from the SI fox station that the competitor last registered

or the time from the finish station if no fox was stamped.

**Fox xx** The timestamp of the selected transmitter is taken as the finish time. The timestamp can be provided by the SI chip or the SI station.

- If the **Positions** of the transmitters are indicated a picture with the scaled positions is displayed within a 500m grid. The

positions and numbering of the transmitters can be checked. Missing positions are indicated by question marks in the X-Y-position fields. For each category the optimal sequence of transmitters and the shortest distance in a straight line is displayed.

If any location information is missing, the input windows are highlighted in red.

- SI station number list **SI-No**

When using SI devices a translation table must be set up. This is necessary because the SI device numbers are greater/equal than 20 (FjwW use: **20...254**) and the transmitter numbers start with 1. No entries are allowed to be missing or exist double for different transmitter numbers. If an error exist, the data field background is **red**.

In the second edit field it is possible to enter a second/reserve SI number. That brings the advantage when two SI stations used at the fox exactly distinguished will can, out of which station the data come. Or it brings the advantage that in problems with one SI station a reserve station can be used (with not number again of existing SI No).

**Exception in SPRINT:** The spectator point can be in the same location as the beacon, then there is only the beacon transmitter and the SI beacon station. This is set in the competition data in that also for the Spectator one/the same SI beacon station number is entered !>BR> If changes are made to this entries the corresponding TLN and KOR files are (re)read automatically.

- The button  make it possible with running program **FjwMap**, to get rapidly the positions of transmitters and fox lists, which draws/recorded in FjwMap.

The button [Optimum search orders](#) shows the sequences for all categories in a new window (including an option for printing). The button **Picture** allows to save the image as a GIF file.

### Display information about the organizer:

With the button at the right side of the head lines or with **ALT+<** the information of the organizer can be made visible. The following data can be entered:

- Name, call and club of the organizer
- Short title of the competition
- Type of competition (**OFF** – official competition of DARC, **INT** – international competition, **OV** – local competition of a DARC Ortsverband)
- **Foxoring** - Foxoring, any changes for outputs in result lists, graphics with transmitter locations (GIF's) will be display enlarged.
- **Sprint** - Causes the correct counting of rated foxes in non-compliance with the correct search order at Sprint, changed some representations in results lists; must be enabled before reading data from the SI chip or from the KOR/DAT files !
- **Score** - Each fox found can be assigned a score(points) by **manual** score entry after the **@FOX\_SCORE\_LISTE** keyword in the TLN file [see](#) . The points of the found foxes are added and replace the fox number found in the placement of the participants.
- **Multi SI-Card** - Multiple use of SI cards in a competition [see](#) .
- Issue of CQ-DL when the competition was published (data fields: month, year, page).

If **Edit** is activated the data can be changed. With **Save** the data is validated and saved. If **Edit** is unhooked the changes are not applied.

The final saving of the competition data must be done via **File|Contest File save** or **Ctrl+S**.

The information at the bottom right are updated when competitors reach the finish (and their chip is read). The information give a quick overview of the status or the competition.

# The SportIdent status dialog

The SportIdent status window is displayed if the serial interface to the SI station is activated. At the left some important status information about the connected SI station are displayed. At the right the data of the last SI chip is displayed.

The window can be hidden via the **ESC** key. It can be reactivated by clicking on its icon or via **Ctrl+F3**.

## Left part

These data are gained by reading the SI station periodically. The data is updated after the cycle time after reading a SI chip.

- Station number, status of the last request  
Additional information: background  
**green** (Reading station, status ok),  
**blue** (Not a reading station, status ok),  
**red** (serial interface out of order, station switched off) or  
**white** when the SI card number is displayed and the card is cleared (absent data of foxes/start/finish).
- Function of the station, type of acoustical and optical signals when registering a SI chip
- Serial number and CPU number of the station
- Deviation between the clock of the SI station and the PC. If the date of station is different as the PC date, the text **? Date ?** and a red background will be displayed.
- **Time of the station**
- **Number of used memory blocs / capacity of the station in memory blocs**

## Middle part

- **Time of last backup of the data of the station**

- Data of last SI chip read (time of check, start time, finish time, SI chip ID, start number)

### Right part

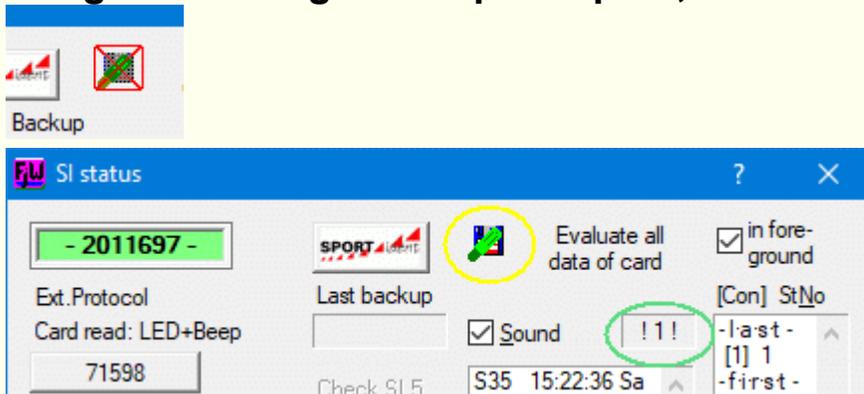

- In the left list box the time stamps of the SI chip are displayed (!never! converted to real times with the help of the begin time) and the station number of the transmitters
- In the right list box to each SI chip number the related competition number and the start number of the TLN file are displayed. The latest card read is at the top.
- Checkbox *Sound*: If activated each time a SI chip is inserted into the station or drawn out of the station a sound is played.

### Upper part

The following symbols and writings are not displayed in normal operation:

- **Blinking SI logo encourages to make a backup with *Erase station after backup* of the data of the SI station. When the capacity of memory is reached, all older data will not be available. This warning is displayed if the memory is filled up to 90%.**
- **As long as data is read from the SI station a small animation is running red border).**
- **If the SI chip read cannot be attributed to any competitor an acoustical signal is activated (4 times the Windows system sound "Question"). The background of the list box with the time stamps is cross-hatched in **red** and beside the **green** border the total number of not attributed cards is displayed.**
- **A small icon showing a diskette and chip is displayed if the time stamps are saved to the related KOR file (**yellow** border). If the stamps are not saved the icon is **gray with red cross**.**
- **If data is received from a SI card or on the serial interfaces B/C for which no competition is found where it can be**

assigned to a registered participant, this icon appears:

### Lower part

- If on COM-B or COM-C the reception of transmitter data is activated those competitors, who logged in a start, finish or a transmitter station are displayed in the box. The following information is displayed: SI-station-number or "Start(3)"/"Finish(4), SI-card number, name of the competitor (if it is found using the SI-card-number) and the DOK. The box can be enlarged in order to see up to 200 time stamps.

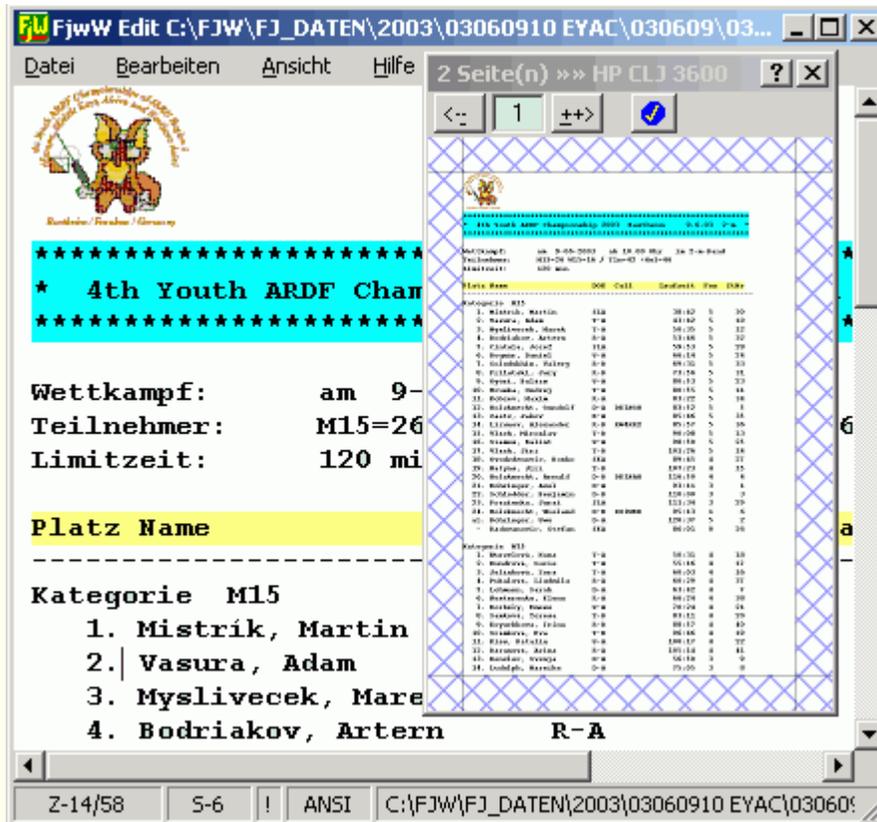

Remark: The sounds are only played if they are activated on the PC (Windows system sounds).

# The Text/Edit window

This window represents a **full editor** with various functions:

- The editor is able to load RTF files with embedded pictures, is able to insert, remove, change (in size) pictures in TXT/RTF (then to save as \*.RTF) and define the text background
- More possibilities to edit (compared to programs like Notepad/Wordpad)
- Support of shortcuts for quick editing
- Context menu when clicking with the right mouse button (equals the menu **Edit|...** )
- Search and replace of portions of strings, go to a given line number
- Display of actual cursor position (line/number of lines – column)
- Extended undo and redo functions
- Opening and saving of text files in format (TXT) or Rich text format (RTF)
- All windows compliant formats for font and colors
- Drag&Drop of selected texts
- Print with background picture(s)
- Zoom within the editor window, correct print preview

Example for insert graphic, setting color of text background and print preview.

This editor is also used for displaying the lists (when this option is activated). By this the printouts can be reformatted before they finally are printed.

The editor window can be brought to the front by pressing **Ctrl+F5** if any other FjwW window has the focus.

Since V10.10: with the Shortcuts **Ctrl+Alt+E** or the command line "FjwW /E" the editor of FjwW can be start quickly, as often as you like and using for displaying and editing of arbitrary text files.

If the LOG file is displayed via **Extras|LOG File** or via **Ctrl+G** the background is light grey and the content can not be changed. The cursor automatically jumps to the last lines of the file.

## The menu of the editor

### File menu

- **New**     *Shortcut Ctrl+N*  
Creates an empty file of the same type as the last file (ANSI / UTF8 / UTF16 / RTF).
- **Open**     *Shortcut Ctrl+O*  
Opens a file to be displayed or edited. UTF8, UTF16 or RTF files are recognized automatically by its content of first characters in file. The background is changed to light blue for RTF files.
- **Save**     *Shortcut Ctrl+S*  
Saves the file with the same name.
- **Save as**     *Shortcut Ctrl+Shift+S*  
Allows to save the actual file with a new name. When file is a text file of ANSI, UTF8 or UTF16 format, the format of saved file can be changed.
- **Save as RTF**  
A text file (ANSI / UTF-8) can be saved as a RTF file. This is needed if font formatting or picture insert was used on a text file. These formatting are lost when saved to a text file.
- **Print**     *Shortcut Ctrl+P*  
Allows to print the whole document or single pages with the same formatting as displayed in the editor window.
- **Print with Picture**  
The printed pages can be enriched with a watermark in several positions of the page (corner/center), independent of adjusted margins. The transparency and the largeness of the related picture (BMP-/GIF-/JPG format) can be set up as needed. An example is shown [here](#) .
- **Print Setup**  
The margins and paper format are respected when printing. If **View|Row/Word Wrap** is not activated the lines are cut after the maximum length of the line has been printed. The additional characters are not printed.  
If the margins are set to values below those which the printer supports these values are changed to the minimum which is supported by the printer.  
When the print option is first used the initial values are taken

from the [INI file](#).

**[Edit]**

; printing margins for top, bottom, left and right in mm

**mTop=10**

**mBottom=10**

**mLeft=15**

**mRight=8**

- **Quit**

### **Edit** menu

- **Undo**    *Shortcut Ctrl+Z*  
The last change are revoked. Can be used multiple times.
- **Redo**    *Shortcut Ctrl+Y*  
Reestablishes the previous status. Can be used multiple times.
- **Select all**    *Shortcut Ctrl+A*
- **Cut**    *Shortcut Ctrl+X, Shift+Entf*
- **Copy**    *Shortcut Ctrl+C, Ctrl+Einf*
- **Paste**    *Shortcut Ctrl+V, Shift+Einf*
- **Find**    *Shortcut Ctrl+F*
- **Replace**    *Shortcut Ctrl+R*
- **Go to Line**  
After inputting a line number this line is selected.
- **Font**  
The font for the selected text is changed. If no text is selected the font is used from the position of the cursor on.
- **Last Font apply**  
The last used format is applied to the selected text.

### **View** menu

- **Row/Word Wrap**  
If **to width of window**  
is selected the wrapping is done depending on the size of the editors window.  
if **to width of printing page**

is selected the wrapping is done depending on the settings of the printer **File|Print Setup** .

- **Print Preview**

The window displays the page as it will be printed according to the settings made in **File|Print Setup** . Changing the settings updates the content of this window(-s). With this possibility it can be checked which settings are the best to make the text fit into a page.

In the small window at the top the page can be keyed in immediately. With **Alt+ (+)** or **Alt+ (-)** the next or the previous page are selected. Unhooking this option disables the preview window.

- **Normal 100% Zoom 80% Zoom 60%**

The display of the file is set accordingly.

- **Main Window**    *Shortcut Ctrl+F2*

The main window of FjwW is selected and activated.

# The Correction dialog

The correction window is used to display the data of the selected user. It also allows the change of all data.

The content of the data fields of the displayed user can be corrected immediately. The changes can be **Saved** into the [KOR file](#) \*.KOR. If not, they have to be saved into the TLN file using the menu options **File|Contest File save** into the [TLN file](#). Using **Cancel** discards all changes.

In this window the Shortcut can be used for the quick entry or modification of data. For example to enter the starting time to 12:05 only the keys **ALT+E**, **ALT+T**, "12 5", **ENTER** have to be used.

FjwW remembers where the operator before the last Save command and sets the input cursor, repeat again in this field. For example, the change of starting times of several participants will be easier.

## Upper left part

- The picture shows the distribution of the transmitters in true scale. The background shows a grid with 500m distance. The search order is marked with lines and arrows.

## Upper right part

The input of the start and finish times is easy because numbers can be separated by spaces or any other special characters!

- **Fox No:** (0...62) With 0 transmitters the competitor is not taken into account in the ranking.  
The background is **blue**, if the time was changed manually.  
The withdrawal of the manual change can be done by entering the percent symbol **%**.

- **Start time:** The start time must be after the beginning of the competition and before the end of the competition minus the limit time. If 0 is entered the competitor is set as **not&compl;started**. Based on the start group the start time is calculated automatically. The interval between the start groups is assumed to be 5min. This value can be modified within the TLN file at the keyword **@START\_BALLOT** or via the menu with **File|Balloting Start Times** . The background is **blue** , if the time was changed manually. The withdrawal of the manual change can be done by entering the percent symbol **%** .
- **Finish time:** The finish time must be after the beginning of the competition and before the end of the competition. If 0.00:00 (or simple 0) is entered the competitor is set to **not compl** (not completed). The competitor is not taken into account in the ranking.  
The background is **blue** , if the time was changed manually. The withdrawal of the manual change can be done by entering the percent symbol **%** .
- **Transmitter time stamps:** To modify the transmitter number or time it must be selected. After selection the modification can be done in the upper right field. If 0 is entered the transmitter is not taken into account anymore. All changes are saved only after pressing the **Save** button.  
Manual corrections in the time field can be revoked by entering the percent symbol **%** .  
Modified transmitter times are marked with a **!** after fox time.  
Other mark:

  - \*** Transmitter was found but is not taken into account because it's not in the list of transmitters to be found by this category.
  - #** Transmitter was found more than one with a time difference > 1 minute
  - +** The timestamp is out of the range of the start and finish time (must be checked)
  - ?** Timestamp is not valid (must be checked)
- **For all time stamps:** In competitions over two days an **a** attached to the time indicates a time from the second competition day.

## Center part

- **Name, First name** are rejected if another competitor with the same data already exists within the same competition. Name and first name are bind together as Name, first name und limited to 24 characters.  
To learn more about the structure of the name [see](#) 
- **Club** (also useful for country data) is an additional field for the competitor data. It is used to build the team or district result lists.
- The **Group** filed allows the result evaluation for a subset of competitors. As an example this field can be used to evaluate the results separated by domestic and foreign competitors of the competition.
- **Chip No** of the SportIdent card (4...7 digits). If this field is changed all the time fields are first deleted and then reread from any related KOR/DAT file. The card number can be marked as 'Rent chip'. Lend cards are marked with an asterisk in many lists and displays.
- **Bonus** Time bonus in minutes, negative values extend the time; in the results list, the change is indicated by a plus/minus sign (+/-) after the time.
- **Status** sign marks the competitor as being a 'Peilmeister'. This sign is used to calculate the German diploma points in the result list.
- **Abandonment** The competitor will be not placed and not display in the list of at finish expected competitors; when the competitor have a finish time, the 'Abandonment' is reset.
- **Disqualification** The competitor will be not placed and not display in the list of at finish expected competitors; disqualification will be declare by the organizer/jury.
- In the **Category** field any combination of up to three characters can be used. If no standard denominations are used a neutral icon is displayed in the toolbar of the main window of FjwW. Anyhow the text of the tool tip shows the written text.

## Lower part

- To **Selection** any name or start number just key in the first (or all) characters of the name or start number. Pressing cursor down key or the button of the select box a sorted list of the competitors of the competition is displayed. The wanted entry can be selected and the data of this competitor are displayed.
- **OK** or **Apply** saves all changes to disk. After **OK** the window is closed, after **Apply** further changes can be made or another participant can be selected.
- The window can be left with **Close** or **ESC** if no unsaved changes exists. In any other case a confirmation is requested.

### To open up right part

- Nach Klicken des Button `<<<<--->>>>` wird der rechte Teil des Dialoges um ein Listfeld erweitert (oder wieder geschlossen). FjwW durchsucht die KOR-Datei nach der SI-Chipnummer des im Dialog gezeigten Teilnehmers. Auf diese Weise werden alle vom SI-Chip gelesenen Zeitdaten verständlich aufbereitet.
- Die Zeile über dem Listfeld erklärt, was in den Spalten dargestellt wird:
  - SFF**: Start-/Fuchs-/Ziel-Daten stehen in der Zeile
  - SINo**: Nummer der SI-Station, von der die Fuchs-Zeitstempel stammen
  - Time**: Zeit des Zeitstempels (hh.mm:ss)
  - Date**: Datum des Zeitstempels (dd/mm/yy)
  - KOR line**: Zeilennummer der KOR-Datei, in der der Zeitstempel zu finden ist
- Die Datenzeilen werden farblich hinterlegt:
  - hellblau** Kommentarzeile, die die Zeit des Empfangs/Auslesens des Zeitstempels zeigt.
  - hellgrün** Gültige Zeitstempel, die für die Wertung des Teilnehmers übernommen werden.
  - <>- <>- <>** Zeile signalisiert, daß ein Zeitsprung rückwärts zwischen der vorrigen zur nächsten Datenzeile auftritt. Zeitstempel werden im SI-Chip nacheinander gespeichert, so auch ausgelesen und in die KOR-Datei geschrieben; gültige Zeitstempel eines Wettkampfes müssen also zeitlich

aufsteigend sein. Dieser Fall kann so z.B. darauf deuten, daß der SI-Chip nicht vor dem Wettkampf gelöscht wurde.

# The Registration dialog

In this dialog the following actions can be done:

1. Manual entry of the necessary data of a competitor and insertion to one or several loaded competitions.
2. Selection of a competitor from a previously loaded name data file. The selection can be done by entering the name+first name (or parts of it), card number, club or call. All entries can be modified.
3. Automatic selection of a competitor from a previously loaded name data file by reading the SI chip which corresponds to the competitor. The chip can be marked as "lend".
4. Quickly find a subscriber belonging to an unknown SI card number.
5. Update, addition, comparison of entries in the name data file including saving to a new file.

One or more Name list(s) can be load with drag&drop to the registration window. The name, in one process loaded name list(s), FjwW stored in the registry and loads the Name list(s) again when you open the dialog again.

At storing all contained entries, also inserted entries (button **+** **New** ), will be saved in a new file.

## Details for 1.

Enter all data for the competitor in the upper select box. Indicate a **Start No** (or use the **Vacant No** button) and **Insert** this competitor into the actual selected competition. The competition is indicated in the windows title bar. Any errors are indicated. The SI chip can be marked as "lend". Lend chips are treated specially within the program.

Names should preferably be entered as '**Lastname, Firstname**' or '**Firstname Lastname**' [see](#) 

If a competitor is inserted with a category that does not yet exist and there is already a fox list for the category " " or "kK!" (no class rating) was created, this fox list will be assigned to the participant.

After changing the actual competition the competitor can also be inserted into this one. Please keep an eye on the selected competition if more than one is loaded. You can avoid problems with this carefulness.

To select the wanted competition it can be choose by using the *Shortcut* **Ctrl+Shift+1 . . 9** (for the first nine competitions) or by using **Ctrl+Cursor down** or **Ctrl+Cursor up**. By this way you can easily insert one competitor to several competitions you're preparing.

### **Details for 2:**

The better possibility to insert competitors to a competition is to use a name data file or any TLN file or a CSV file (created with TLN key words). In this case a competitor can be selected from the already existing entries within this list. Several data files can be loaded if the ***Append*** is checked. All data from all loaded files are sorted alphabetically within the select boxes. Competitors can be easily found with the four select boxes. They can be modified and inserted to the actual competitions as described in 1.

The name of the last loaded files are saved on closing the dialogue in the registry. When reopening the dialog, also after re-start FjwW, they are loaded immediately.

To find a competitor using the name you can proceed as follows:

- Open the select box with the button or just press **Cursor down**. Key in the first character(-s) of the name. The

list is updated with every character keyed in. Mark the wanted entry by pressing **Cursor down** and **ENTER** or just click on it.

- Key in the first characters of the name and press **Cursor down**. The select list is opened and the available entries are displayed in alphabetical order. Mark the wanted competitor by pressing **Cursor down** and **ENTER** or just click on it.
- If a participant has been selected and has more than one card number (ie a **SI????/?????** in the comment field), only the card numbers used in the chip selection box will appear, from the one can be selected. With "Show all SI" in the first entry, the card numbers of all participants can be displayed again.

Details and examples for a loadable [Name data file](#).

### Details for 3:

The registration of the competitors can be speed up by reading the SI chip and searching within a name data file. To do this the following preparations must be done:

- Connect a SI reading stations to the serial interface.
- Activate the interface in the menu **Interface|SportIdent** .
- Open the windows **Edit|FH/Hlp Registration** and load a name data file with the button at the left (for example the supplied **NameList?.txt**).
- Check the checkbox **Chip-Registration** . If the background is **green** everything is ok. If the background is **red** the SI station is not ready. If the background is **blue** , the SI station is not programmed as a read station.

After reading the SI chip the checkbox **Chip-Registration** becomes unchecked and the data of the related entry of the name data file is displayed. If the data is not the data for the competitor it can be modified or another entry can be selected (see Details for 1). The SI chip number read can be taken over with the small button at

the right. If the SI chip has not been cleared, the number will be **red** or **white** (when cleared) in the background. When all data are complete ***Insert*** has to be clicked.

To register the next competitor the checkbox ***Chip-Registration*** has to be activated again.

If a chip has been read in the time the previous entry was treated, the card number is used immediately when the checkbox is activated. You can see that a chip was read in the [SI status window](#).

In the menu ***Interface|Display results*** in the area ***Display*** the entry ***\*\* Registration \*\**** can be chosen. If this is done the data of a new competitor is sent to the DisplayPC immediately after he has inserted his stick into the SI registration device as long as his name is found in the NameList. If corrections of data have to be done in the correction window they are not automatically updated on the DisplayPC after pressing enter. By pressing  the update on the DisplayPCs can be forced. After inserting the competitor the last five registered users are (re-)sent to the DisplayPCs.

For further details about the sending of data to the DisplayPCs [see](#) 

#### **Details for 4:**

If an unknown SI chip number is read at the finish the data is shown in front of a hatched background in the [SI status window](#) ). When activating the checkbox for ***Chip Registration*** , the data of the related competitor is displayed if he's known in the file (of course a data name list has to be loaded).

To register a participant, the ***Chip Registration*** must be activated. After reading the SIchip, the corresponding participant will be searched for and displayed in the list(s) of names (if available) and can enter the current competition. If another SIchip is already read out with ***Insert*** before adding it to the competition, this previous SIchip will be inserted into the window ***'Unregistered***

**SI chips, CTRL+Q'** inserted and can be edited later with a double-click.

### Details for 5:

Append: load the name data file which should be updated; enlarge the window using the **<Special>** button; activate the checkbox **Append** ; load the TLN file of the competition which contains the competitors to be added; activate **Merge** and then **Search** for entries with inconsistent data to correct them. The number of entries is always displayed at the lower left corner.

The modified name data file can be saved after these corrections.

Update: Select the competitor to be updated or choose the first entry (**\_\_neu\_new\_\_**) in the upper select boxes, the data are displayed in the fields in the middle part also. Checking **Edit** activates the fields. Using  **update** accepts the changes. With  **delete** the entry is completely deleted and with **+new** the entry is added to the already existing entries.

If the card number is following by a plus sign (+) it is marked as lend.

Using **Merge** several things can happen. If two entries are identical, one of them is deleted. If two entries have the same name and the same first name and the other data are not contradictory they are completed with each other. After this one of the entries is deleted.

Example: one single entry is created based on two incomplete entries.

```
Schade, Karl-Heinz  6613  D21  DL7VDB
Schade, Karl-Heinz                DL7VDB  1950  M60
-----
Schade, Karl-Heinz  6613  D21  DL7VDB  1950  M60
```

Using **Search** searches for entries with identical card numbers. Corresponding pairs are displayed in the upper select boxes and the

entry fields in the middle. Identical calls or card numbers are marked with == == ==.

### Examples:

Stein, Jens	6310	B01	DL8KAN	1964	M40
	== ==				
Voit, Günter	6310	B11	DK1SC		M60

If two competitors have the same name and first name and differing other data they are marked with <> <> <> in addition.

### Example:

Biehl, Dieter	411791	M25	DK8LU	1950	M60
== == == ==	<> <> <>			<> <>	
Biehl, Dieter	235677	M25	DK8LU	1951	M60

Afterwards the name data file can be saved again. The competitors are sorted alphabetically. Each data field is separated by a tabulator. Also the existing and new comments for each competitor are saved.

While reading the name data file the year of birth and the category are tested. When a regular IARU category is encountered the year of birth and the category must much (based on the actual year). If they don't match a question mark indicates the mismatch. Using

**Search** these competitors are displayed and a manual correction can be done. Details about the IARU categories can be found here: [category designations](#).

More details can be found in the [FAQ-9 section](#) .

# The Ballot starting sequence dialog

Before raffling the start times the following information are required:

- 1) How to treat the start times already set (manual or automatic); only if not all start times have been set the raffling can be done
- 2) Distribution of the competitors of each category within the number of start groups set in **3c**).
- 3a) Maximum number of competitors of one category who will start in one start group. The default value is 1.  
Maximum number of competitors who will start in one start
- 3b) group (regardless of the category!). The default value equals to "number of categories \* number set in **3a**)".
- 3c) Total number of start groups. The number cannot be reduced below the necessary number of start groups.
- 4) Balloting the participant of all categories or of a chosen category.  
If the participants should not be ballot with start times from the competition-beginning time, the first (earliest) start time can be
- 5) changed within competition beginning till the competition end minus the limit time.  
'Pseudo-categories' can be made up of several categories
- 6) whose participants are treated like those of a category when they are ballot. If **3a**) =1 is selected, more than one participant from these categories will never start in the same starting group.

The settings must be done in the given order because they influence each other. For the given settings the latest start group is displayed.

The interval between the start groups can be set individually. The default value is set to 300sec=5min or 120sec=2min.

The distribution of the competitors of each category can be choose as being followed *in all* or *in first only* start group after the **First start time**. Selecting **Mass start** sets the start time of all competitors of selected category(ies) to the 'First start time'.

Raffling can only be done if competitors without a start time exist. If necessary the already existing start times can be deleted by checking the **Existing start times deleting** checkbox. If this box is checked it can be decided if **all** start times should be deleted or only those which where previously **balloted**. Only the times of competitors of selected category(ies) will be deleted.

If **Existing start times deleting** is not selected the existing start times are taken into account as long as they are within the first and the last time displayed in the upper right corner. Start times outside these boundaries do not influence the raffling. Start groups can also be set manually. In the case that the number of competitors per category is already reached or exceeded no more competitors of this category are added to the starting group.

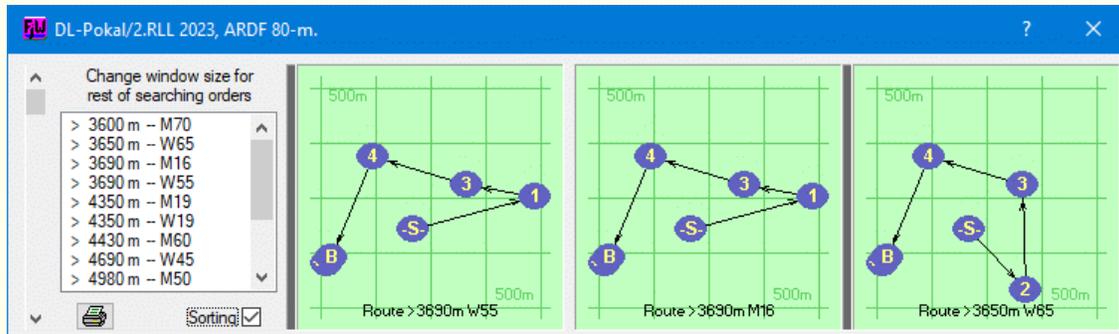

In the lower part a set of categories can be combined as "Pseudo categories". Competitors within these pseudo categories are treated as being within the same category. Competitors within the pseudo categories will not start in the same start group unless the maximum number of competitors of one category is larger than 1. The number of competitors within the pseudo category can have an influence on the **total groups**.

The raffled start times are written to the KOR file immediately. The KOR file has the same name as the actual TLN file. If it already exists, the times are appended to it. If the KOR file does not exist it is created automatically.

Pressing the button **Start order** shows the start group distribution of the competitors in a table and give the possibility for simple change the starting order. Details can be found in [FAQ-8](#) 

# The Search order window

In this window the optimal search orders for all categories are displayed. By scrolling or enlarging the window more than two categories can be displayed. In the upper left part of the window the minimal distances per category are displayed. The list is ordered by the length of the tracks.

All graphics can be printed on a chosen paper format.

For each category the shortest track in a straight line is displayed.

If **Sorting** is activated, the identical search sequences are displayed one after the other and delimited by black vertical stripes.

Because of an algorithm to investigate the optimal searching order of **Keld Helsgaun (keld@ruc.dk)**: An Effective Implementation of the Lin-Kernighan Traveling Salesman Heuristic

Department of Computer Science, Roskilde University, Roskilde/Denmark  
there is no longer this restriction.

If the location of the transmitters is changed within the competition window the optimal search orders are recalculated and refreshed immediately.

## The Result display dialog

In this window several settings can be done concerning the sending of results, registration or finishing data to the display PCs. There is running program **FjwWdispl** (or ~~FJWDISPL~~ on DOS PCs).

The data which should be displayed can be sent over three different serial interfaces and/or three different LAN ports. There is no interaction between the DisplayPCs and FjwW. FjwW is sending all data as a UDP broadcast.

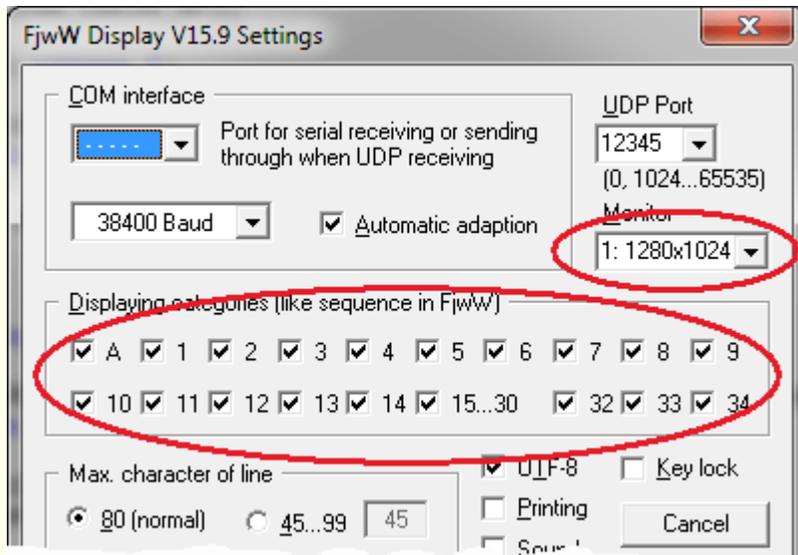

For each of the three port-groups one serial port can be selected and/or the fixed LAN port related to each entry can be activated as well as the type of data to be sent. The first LAN port is specified in the INI file via **UDPport=12345**. Beginning from this first port five ports will be used. If ports are already used in the network it can be changed in the INI file. FjwW must be restarted to take the changes into account. With using of WLAN for data transfer to DisplayPCs it can be sensible to increase the delay time while sending the data in the INI entry **UDPdelay=**.

The data is displayed on those display PCs connected to the related serial interface or which are "listening" on the defined LAN port. The LAN port must be choosed when executing FjwWdispl.

Since the FjwW version 9.11 a check sum is calculated for the displaying data of every category and is transferred with. If this data in FjwWdispl are received incorrect by test of the check sum, the category will not be shown (required also FjwWdispl since 9.11).

Each page sent by FjwW has an ID number. When starting ~~FJWDISPL~~ and ~~FjwWdispl~~ the pages to be displayed can be defined by these ID numbers.

In **FjwWdispl** this will be entered in first dialog, only 14 categories can be chosen individually, more can be choosen by 15...30 and

about the command line options (see below).

If there are several monitor outputs, the monitor can be chosen in the combo box at right.

The combo boxes for the COM interface and the UDP port contain only the port numbers that are available. For the UDP port any port number  $\geq 1024$  can be entered manually.

**ID numbers** of the pages with the **current result lists** (set display width to 80 characters per line or more when starting FjwWdispl). See **example 1** for a foxoring with a big amount of transmitters.

- 0 = arrival list of competitors (**A**)
- 1 = first category in FjwW (e.g. **W19**)
- 2 = second category in FjwW (e.g. **W21**)
- .....
- 11 = ninth category in FjwW (e.g. **M70**)
- .....
- 30 = last category supported by FjwW

**ID numbers** of the pages with registration or finishing data. (recomendation: set 45 characters per line when starting FjwWdispl)

- 32 = data when registering via SI chip registration (see **example 2**)
- 33 = data of the last five registered competitors (see **example 3**)
- 34 = finishing data which was read out of the SI chip (see **example 4**)

For more details concerning the display of data using display PCs [see](#) 

Characters per line was set to 99 in **FjwWdispl**

```

## The Finish timekeeping window

The time tacking window is always kept in the front. By pressing the **space bar** or by a mouse click the current time shown on the screen is stored. The stored time and entered number of transmitters is attributed to a competitor by entering his start number or by selecting him.

Before using this functionality the time of the PC should be checked. If it's not in line with the time taking stations it should be corrected.

The times, which are stored are kept on a stack. The latest time is on the top. The former times are below in the list. A maximum of 10 times can be stored in order to be attributed to the competitors. If more times are taken, the oldest ones are lost. The times can only be attributed to competitors of the selected competition. If more than one are loaded the right one has to be selected before attributing the times. If the current time is outside of begin and end of selected competition the background of label **Start No Name** becomes the color **red**.

The button on the top, which is displaying the actual time, is used for the manual time taking. The button is active if the characters are shown in big and upright characters (it has the focus). **Attention:** The time is taken when the space bar is released! Therefore press it only for a short time. Using the mouse, the button can be clicked for time taking at any time, even if the characters are shown in small, italic characters. **Attention:** The time is taken when the mouse key is released!

By taking the time it is stored on top of the time stack. Using the **TAB** key or by a mouse click the input field for the start number can be selected in order to attribute the time as finish time to a competitor. At the same time a drop down list is displayed beside the input box. This list shows all competitors not yet finished. Either the start

Cur.	Time	Start No	Fox	Name
3	11:34:22	1	5	Schade, Karl-Heinz
2	11:33:17	0		
1	11:32:01	2	5	Schade, Steffen

number of a competitor can be entered or he can be selected out of the list by clicking with the mouse or by typing the first letter of his name. The **cursor down** key can be used for

selecting a competitor. By clicking on **OK** or by pressing the **ENTER** key the finish time and the entered number of transmitters is attributed to the selected competitor.

# The structure of menus

The screenshot shows the ARDF organizer software window. The title bar reads 'ARDF organizer'. The menu bar includes 'File', 'Edit', 'Results', 'Interface', 'Extras', 'View', and 'Help'. Below the menu bar is a toolbar with various icons. The main area contains a table with the following data:

StNo	PI	Name	Club	Call	Run ti...	Fo	Start	Finish	Chip No	Sequence	Cat	Birth	Status	GRP
7	1.	Van Britsom, Marc	BEL	ON4FOX	57'02	5	10:25	11:22:02	43705	S-2-4-5-3-1-F	M50	1966		BEL
2	2.	Daverveld, Marcel	NED	PE5TT	61'41	5	10:15	11:16:41	2096717	S-2-1-5-3-4-F	M50	1965	PM	
11	3.	Eichler, Gerald	Z21	DL1DSR	64'30	5	10:15	11:19:30	411769	S-2-3-1-5-4-F	M50	1966	PM	
23	4.	Pohl, Walter	G10	DL5KCS	73'18	5	10:30	11:43:18	362809	S-2-3-1-5-4-F	M50	1963	PM	
4	5.	Plantagie, Benno	NED	PA3FBX	76'55	5	10:20	11:36:55	2045553	S-1-5-3-2-4-F	M50	1964		

At the bottom of the window, there is a status bar showing '[1] of 1', 'M50=5', and 'Classic 2-m-ARDF-Wedstrijd, Maasmechelen, Belgie.'

The main window Additional help is available by clicking the elements of the window !

# The File menu

## Read

### **New competition**      *Shortcut Ctrl+N*

There are three possibilities to create a new competition

- Competition creation with some default values  
Some data of the competition are set to default values. These values should be corrected immediately (for example the competition date) and the missing data should be added in the competition data window.
- Competition creation from content of clipboard  
The TLN file can be created with applications like **Word** or **Excel**. Before the data can be used in FjwW it has to be copied into the clipboard. If no errors are encountered a TLN filename is build based on the date of the competition and the band.
- Competition creation from (default)TLN file  
It may be the TLN file of another competition or a prepared (default)TLN file to be used.  
An option also allows the import of the participants in this TLN file.

The TLN file name consists of the date of the competition and a serial number which starts with 1 for every new day. The proposed file name can be changed in the dialog.

Using **Edit|FH/Hlp Registration** the competitors can be added to the competition. The data must be saved with **File|Save competition file** or the keys **Ctrl+S**. The TLN file automatically receives a name (year-month-day-serial number) and is also emerging as the KOR-/BAK files in the log directory under FjwW or in the directory, which can be

**File|Options|Path for new competition** (the path must be writable!).

***TLN competition file read***      *Shortcut Ctrl+O*

The TLN file (\*.TLN) contains all relevant data about the competition and the data of the competitors. If an error is detected the reading of the file is stopped. A message box shows the type of the error. In the log file the line with the error is indicated. The log file can be displayed with **Ctrl+G**. If the option

***Data to TLN automatic read*** is activated the related KOR- and DAT-files are loaded automatically (for example: After opening **020317.TLN** the related files **020317.KOR** and **020317.DAT** are loaded).

Up to 32 competitions can be loaded one after the other. All loaded files can be used for summary evaluations. The content of a TLN file is explained with the example of a [TLN file](#).

The character coding of file can be **UTF-8** or **UTF-16**.

***KOR competition file read***      *Shortcut Ctrl+K*

If for the loaded TLN file corrections within a KOR file do exist, this file has to be read as well. The KOR file is always joined to the actual competition. The actual competition is displayed in the left part of the status bar or in the toolbar.

A KOR file with the same name as the TLN file but with the extension KOR is created when corrections are made to the competitors or if the start times are raffled. If the KOR file already exists the data is appended to this file. For FjwW only one KOR file exists in which the manually changes and readed SI chip data is written. After opening and reading a KOR file using this menu item all subsequent SI chip data is written to this file (attached).

Example of a [KOR file](#).

## ***DAT data file read***     *Shortcut Ctrl+D*

The time data originated from a start/fox/finish station can be read from this data file. The result list is updated with these time data. The DAT file is always joined to the actual competition. The actual competition is displayed in the left part of the status bar or in the toolbar.

If an error is encountered the reading is stopped. At the end of the log file the line with the error is indicated.

## ***Competitors from TLN import...***

Competitors contained in a different TLN file than the current one can be included in the current competition as long as the competition does not contain any competitors.

## ***Competitors read from CSV...***

Additional participants can be added by importing a CSV file to the current competition. The file must contain the first line the default key words. [see](#) 

The character coding of file can be **ANSI**, **UTF-8** or **UTF-16**.

## ***Competitors from CSV (INI keys)...***

Participants can also be added to the current competition by reading a CSV file. The first line of the file must contain the accordingly keywords that are in the INI file under **ReadUserCSVger=** or **ReadUserCSVenu=**. The data in the CSV file can come from an online registration portal, for example.

## ***SI.ReaderUI CSV read...***

The software "SPORTident.ReaderUI" (see [www.sportident.com](http://www.sportident.com)) is able to store readed SI chip data in a CSV file.

FjwW is able to read in this data. A short example here:

```
EventId;SI-Card;CN;Mode;Source;DayOfWeek;PunchDate;PunchTime;No;Cnt  
1;1300076;;STA;RDO;2;2000-01-01;13:28:00;0;3;  
1;1300076;31;CN;RDO;2;2000-01-01;13:56:44;1;3;  
1;1300076;32;CN;RDO;2;2000-01-01;14:16:33;2;3;
```

the contained date **PunchDate** is without any meaning. A data line is only used if **DayOfWeek** corresponds to the weekday (Su...Sa=0...6) of the competition day. The day of the week is set to '7' on the Slcard5 and is replaced by the day of the week of the competition when it is imported. When the competition is reloaded, the CSV file must also be read in again.

### ***EDAD read...***

A file with the EDAD format is opened. The EDAD file contains all necessary data of a competition if it was created with FjwW. It contains all relevant data from the TLN, KOR and DAT file.

With the EDAD file the competition can only be used for **offline** analysis and result evaluations. No additional data can be read from SI stations. All results can be displayed or printed. Data of the competition or the competitors can not be modified.

With the program **EDADcheck** files not coming from FjwW can be tested.

## **Special**

### ***Balloting start times...***

With this the start times of competitors can be raffled. The repartition into the start groups can be displayed immediately after raffling. For details [see](#) 

### ***Team balloting (RUS)...***

In Russia there is a special way of balloting the starting times. The participants of a team in each category should be started as far as possible. Obviously, it is intended to hinder or prevent possible cooperation between the team members. In each case a random

participant of the teams form a starting block, the next block is formed with another random participant from the teams [see](#) .

### ***IARU-R1-ARDF-WG Balloting...***

With this the start times of competitors can be raffled concerning the rules of the IARU-R1-ARDF-Workinggroup. This will be used on World-/Region1-/EYAC-Competition.

For details [see](#) .

## **Save**

### ***Save competition file***      *Shortcut Ctrl+S*

The file containing the competitors data is saved with all its data as TLN file (always as UTF-8). The existing file is overwritten.

Saving is only possible if updates have been done. If an EDAD file was loaded it can not be saved as an TLN file.

### ***Save competition file as***      *Shortcut Ctrl+Shift+S*

Using this option allows to save the TLN file to a new file. Depending on the ***Results|Options of Lists*** choice it is possible to:

- create another TLN file for the same competition
- create a TLN file for the next day (entries marked with **#?** must be changed usually).

The filename must be different compared to the actual competition.

Comments which did exist in the original file are not saved to the new one. The character set of the saved file always is UTF-8. The data columns are aligned with the related headline. To align the columns spaces are used (not tabs).

### ***EDAD save***

A file containing the results written to the disk. The format of the file is EDAD V2. This format is a human readable format which is secured by a checksum. It is used to exchange results with other persons.

Within the EDAD file all data about the competition is saved. The character set of the saved file always is UTF-8.

The saved file can be checked with the program **EDADcheck**. This program tests if all mandatory information are available in the EDAD file and it calculates a checksum (check of data integrity).

### ***Current window as HTML ...***

The table shown in the main window (categories, 'On the way', 'Finish reached' will be stored in a HTML file, the standard browser will be open by active 'Show immediately' and show it and can be used to printout.

The order of the columns and a selected column sorting be issued. Very slim / invisible selected column does not appear in the output; a column that was clicked for sorting, but always appears.

## **Options**

### ***Options***

#### ***Data to TLN automatic read***

After loading the TLN file the program searches for a KOR and DAT file in the same directory. If they are found, they are loaded in the given order.

#### ***Save competition BAK file***

A BAK file is created for the loaded TLN file.

TLN BAK file: If activated a BAK file is created under the following circumstances:

- After one minute if changes have been done which can not be saved to a KOR file. Examples are: Adding a competitor,

- changes to the list of transmitters, changes of the card number,  
...
- When finishing FjwW without having saved the modified data before

The filename of the BAK file is deducted from the filename of the TLN file by adding the extension **~.bak**. Example: **050119b1.tln** becomes **050119b1.tln~.bak**.

This option is helpful if the user forgets to save the TLN file or the program crashes. In this case (almost) all data can be found in the BAK file. In this case the original TLN file must be deleted (or renamed) and the BAK file must get the name of the original TLN file. When path of stored BAK file is unknown, it is possible to search with name **.tln~.bak** to find the file.

The existence of an BAK file is indicated in the status bar of the actual competition. The status bar shows an icon and the tool tip of this icon reveals the filename.

If the TLN file is saved via **File|Save competition file** the BAK file is deleted and the icon disappears from the status bar.

### ***Directory for LOG/TLN/(HTTP/FTP) files***

Working with FjwW requires a directory in which temporary files can be written:

- for saving the LOG file
- for saving the TLN files of newly created competitions
- for storing the TXT/HTM/GIF/... files in directory **HTTP** provided by the HTTP server to the browser
- for storing the TXT/HTM/GIF/... files in directory **FTP** provided for the FTP client to upload

When FjwW is started for the first time, Windows provides a writable directory that is located in the user directories. It can be changed with no contests loaded. The directories HTTP and FTP will be created when they are required.

The keywords **HTTPpath=** and **FTPlocalPath=** in the INI file no longer have any meaning.

## Display/Editor

### ***File display/edit...***    **Ctrl+E**

A file can be choose within a file select box. The file is then displayed in the editor of FjwW. It can be modified, saved and printed. The editor can handle normal text files and simple RTF documents. [See also](#) 

### ***Last file displaying***    **Ctrl+L**

The file which was create or loaded as the last one is displayed.

### ***Recent TLN/EDA files***    *Shortcut Ctrl+R*

Up to the last TLN / EDA files loaded with FjwW are displayed. Selecting one of them allows the quick loading of this file. **Ctrl+R** loads the most recent file automatically.

### ***Quit***

Quits the program. If changes have not been saved or if the interface is still active a confirmation is requested.

## The Edit menu

### ***Correction FH/Help data***    **Ctrl+F7**

All important data about a competitor or helper is displayed. The dialog can be accessed by double clicking a line in the result list or if **Enter** is pressed while a line is selected.

For more details see [Correction window](#)

### ***Search FH for unknown chip***

If a participant of the competition arrives at the finish with a chip number with which he is not registered in the competition, the chip number will appear in the "Unknown SI chips" window after reading. This menu item or a double-click on the unknown chip number opens a dialog for entering the start number, which the participant will 'hopefully' wear for quick identification. Then you can see if the unknown chip number can be assigned to this start number, name, etc.

### ***Color signalize***

A marked participant line is marked in color, e.g. to remind of an action.

=====

### ***Copy time stamps from***

When participants do not have SI chip number, possibly as the "follower" with another participant of the contest, a copying the time data (start/foxes/finish) is possible from that user. In the dialogue, the participant and the time data to be copied can be selected. All times are copied marked as 'set manually' and are saved in KOR file.

### ***Set FH out of competition***

The selected competitor can be set 'out of competition' (category set to **aK!**). All data of this competitor stay visible. Data read from files of SI stations is assigned to the competitor as usual. But the competitor is not printed in any result list anymore. However the competitor is displayed on the result list screen. All required data has to be set correctly for such a competitor (for example the list of transmitters is required). This status is supposed to be used for competitors which will be deleted later on.

### ***FH/Help move to deposit*    Ctrl+Del**

Participants and helpers can be moved to a deposit(storage), which should have no meaning in the current competition, they do not appear in any lists, just in the deposit window **Ctrl+C**. However, they are always stored in the TLN file, these lines begin with the dollar sign "\$" as the first character. They are thus still available beyond the competition (use, for example, in multi-day competitions in which the participants participate on different days). The entries in the deposit are not checked for multiple identical entries, names, start numbers, ...

### ***Line move to competition***

An entry in the deposit can be pushed into the current competition at any time as a participant/helper. It is checked beforehand whether a participant with the same name, starting number and/or chip number already exists in the competition. In the window that opens, this is displayed and changes can be made.

### ***Copy to an other deposit***

An entry in the deposit can be copied to the deposit of another loaded competition. To do this, the competition must be selected first.

### ***Marked line delete in deposit***

Only a selected entry in the deposit can be completely removed from the competition.

### ***Complete deposit remove***

All deposit entries can be deleted at once.

=====

### ***FH/Hlp registration***    **Ctrl+Ins**

In this dialog new competitors can be added to the actual competition. The upper data fields can be filled and the competitor is added by pressing ***Insert***. If some data is missing or inaccurate a warning is issued and the competitor is not added to the competition (examples: name already existing, no start number set, ...).

Adding competitors is easier if a name data list is used. The name data list can be the **NamesList.txt** file delivered with FjwW, any TLN file or any CSV file which was created with FjwW. The file has to be loaded before it can be used. When a name data file is loaded, the competitors can be added just by selecting them in the select box.

The fastest way of adding competitors to a competition is the using of the SI chip registration. After finding the competitor just one click is needed to add him to the competition.

For more details [see](#) 

### ***Starting order***

In this window the distribution of start times is displayed. The table contains the start group, the start time, the total of competitors starting in this group and the number of competitor per category. If a number in the right part of the table is clicked the competitors of this start group (line) and category (column) are displayed in the list field on the top of the window. Selecting one of the displayed lines

enables the **New set** of the start time or start group. The modification is marked by two ++ and --.

The start times can only be changed if no data from a KOR/DAT file has been read and as long as no data has been read from the SI devices (serial interface).

=====

### **Quick searching**    **Ctrl+F**

Used to search for data of a competitor when in the main window (result table). The given text is searched within the name, call, club, searching order, start number, SI card number, birth year fields. If a competitor is found he is highlighted and the line containing the search data is highlighted. **Continue** jumps to the next hit. If no more hits are found the search text is marked.

When choosing **Chip-No in all loaded KOR files** (available by entered chip number 1000...9999999) the time stamps of chip stored in KOR files of all loaded competitions will be displayed.

This option can be used to search for whole names or numbers. This can be helpful when searching for a certain SI chip number or the competitors of a certain DOK.

The search includes the activated category, the helpers of all loaded competitions.

### **Remove competition**

In the right list field of this dialog the selected competition can delete ultimate. A competition can not be delete if modified data has not yet been saved to the TLN file or if the sending of results to a display PC is activated.

=====

***Category to the front***  
***Category to the back***

The displayed category can be moved within the order of categories (front = move to the right, back = move to the left). The order of the categories is displayed in the top of the toolbar. The order of the categories is used when creating result lists or when sending data to DisplayPCs. This is specially interesting when displaying selective categories on the DisplayPC ([see](#)  **FjwWdispl** Option /I).

## The Results menu

<a href="#"><u>Single Rating</u></a>	<a href="#"><u>Team Rating</u></a>	<a href="#"><u>Run Time List</u></a>

## Options

### Options of Lists

**Format** Setup of character sets (UTF-8, ANSI, ...) for Text, HTML and CSV lists, TLN file ...

The settings are valid for all loaded competitions.

### **Single Contest**

Here settings can be carried out for the start/result/statistic lists of the different ratings of a single competition.

Settings for the team ranking. It defines how many competitors are part of a team and how many of them are taken into account for the ranking. The default values are **3 / 2**.

For Start-(**STL**)/Result-(**ERG**)/Team-(**MAN**)-Lists it's possible to create them by **User defined columns** . Then the INI entries in paragraphs [**UserListTXT**] and [**UserListHTML**] will be effective [see INI file](#) . Details, example [see](#) .

The settings are valid for all loaded competitions.

### **CSS Layout**

A CSS layout file can be selected. This file is used to format HTML lists (for the moment only available for individual- and team-lists).

Using the entry **\_\_Standard\_\_** creates a fixed layout. The other entries in the CSS directory of FjwW are usable layout files. Additional layouts can be created in the CSS directory, [see example](#) . A layout is inserted as a text within the list or copied into the directory where the result list is saved.

## **Group/pFactor**

**Group-Select:** In this section you can decide which competitors or groups of competitors are displayed within the result lists. The characters "[ ]" selects all competitors who do not belong to a named group. The group filter is only valid for the competition which is selected in the select list.

For more details [see FAQ-3](#).

**Power factor:** If *apply* or the menu option **Results|Power Factor** is activated, the running time will be altered using some factors which take into account the age and the sex of the competitor and recalculated (the time will be reduced depending on the age and the sex); this option can only be activated if the year of birth is entered for all competitors. The sex is deducted from the category. All categories starting with '**W**' are considered to be 'female'. For all other categories the competitors are considered to be male. The INI key word **WomenCatFirstChar=** change the first character of women's categories.

The list shows the factors in % based on age and sex of the competitors. The values are set in the INI-file. The application of the power factors does make sense only if **Not eval in categories** are used to calculate the results. Normally the ranges for the age are based on the standard categories.

The values must be set in the **INI-file**:

**powerFactorName=**

; Part of the running time on which the power factor will be applied

**powerFactorRun=**

; Male categories (age)

**powerFactorMan=**

; Female categories (age)

**powerFactorWom=**

The application of the power factors does make sense only if

**Not eval in categories** are used to calculate the results. Normally the ranges for the age are based on the standard categories.

For all competitors the year of birth must be entered. The sex is deducted from the category. All categories starting with '**W**' are considered to be 'female'. For all other categories the competitors are considered to be male.

LA-ARDF Norway: [www.ardf.no/regler-oslocup.htm](http://www.ardf.no/regler-oslocup.htm)

ÖVSV Austria:

[ardf.oevsv.at/Archiv/ARDF\\_Wertung\\_mittels\\_Leistungsfaktoren\\_nach\\_Cepelka\\_3a.pdf](http://ardf.oevsv.at/Archiv/ARDF_Wertung_mittels_Leistungsfaktoren_nach_Cepelka_3a.pdf)

Here a part of this paper [see](#).

## **Contest select**

In this section those competitions which should be taken into account for multi competition evaluations must be selected.

### **Multi Contest**

This section is used for DARC ranking (Germany). It defines how many competitions are valid and how many of them are taken into account for the ranking. The default values are **4 / 3 / 3** which is the standard.

For the Cup ranking it defines which data (Fox number and Run time or special SRR points in Russia) determine the ranking.

If the options dialog is selected via **Results|Options of lists** all sections and settings can be modified. The buttons have only short texts. The context sensitive help can be used to learn more about each button. Just click on the question mark on the upper right corner and then click on the button you want to know more about.

The options dialog is displayed at each time a list will be created. But in this case only those options which are relevant for this list can be modified.

### **Not eval in Categories**    Shortcut **Ctrl+G**

If this option is activated all competitors are put into one category (regardless of there real category). This category does not have any description. The result is evaluated without taking into account the categories of the competitors. In the toolbar an icon with **kK!** appears. The icons of the other categories are inactivated. Almost all result evaluations are done without taking into account the categories (not true for DARC-RLL). The sending to the display PC omits the categories as well. This option can be activated and deactivated separately for each loaded competition.

## **Single competition evaluations**

### **Single Rating**

#### **Text**

A result list is created containing the rank, name, club, call, runtime, number of transmitters and start number/RLL-/ARDF points. The ranking is evaluated based on the transmitters found and the runtime. Competitors not having found any transmitters or having used more then the limit time are not given a rank. With the option **StT w. not fin.** the start time of the competitor not yet finished is used for the list. This is meaningful to be used for provisional lists which are printed while the competition is still ongoing.

If the result list shall display the ARDF diploma points the FM attribute and the 'type of competition' must be set correctly (this is only interesting for German result lists).

#### **HTML**

Creates the result list using HTML tables and CSS layout, select by user.

#### **RTF**

The result list is created in a simple layout with only a few formatings. Only the widely spread fonts **Arial** and **Courier New** is used. The columns start with a

tabulator. This allows easy reformatting. The different sections are format independently. In WORD (or similar programs) they can be reformatted with a few clicks. The sections are formatted using Title, Comment, Header, SubHeader, ResultRows.

### **CSV**

A file is created containing all relevant data for competitors, helpers and results in **CommaSeparatedValue** file format. These files can be imported into programs like **FjwLay** or **Word / Excel / Access**.

The following data is contained in the file:

```
Category, name, first name, club, call, year of birth, frequency band, place (digit only),  
place1 (digit + extension as 1st/2nd/3rd/4th/5th...), runtime, number of transmitters, start number,  
SET out of the TLN file, start time, finish time, all times from the transmitters.  
or  
for all helpers: name, first name, club, call
```

If the file is created using the options **Data column hyphen -> TAB** and **CSV keyword row -> as TLN** it can be used as a name data file within the **FH/Hlp registration** dialog.

### **Text Club/Country**

When entering the Club/Country name, the first three places and the following are always given in each category if the participants belong to this country.

## **Team Rating**

A number of competitors of one category having the identical club are taken to be a team. For the best ranks of a team the number of transmitters and runtimes are added (no competitor not having transmitters or out of the limit time is taken into account). The team ranking is based on these additions.

In the menu **Results|Options of lists/Special** the number of competitors per team can be defined (default=3). The second value defines how many competitors contribute to the ranking (default=2).

Competitors without club are not taken into account for the team ranking and they are not displayed in the team ranking lists.

### **Text**

A file is created containing the following data of the team members: rank, name, club, call, runtime, number of transmitters, the total number of transmitters and the total of the run times.

### **HTML**

Creates the team rating list using HTML tables and CSS layout, select by user.

## **CSV**

A file is created containing all relevant data for the team members results in **CommaSeparatedValue** file format. These files can be imported into programs like **FjwLay** or **Word / Excel / Access**.

The following data of the team members is contained in the file:

```
Category, rank, team, total runtime, total number of transmitters,  
name1, firstname1, call1, runtime1, number of transmitters1,  
name2, firstname2, call2, runtime2, number of transmitters2,  
.....
```

## ***Text Club/Country***

When entering the Club/Country name, the first three places and the following is always given in each category if the team belong to this country.

The relay race is a special type of result evaluation. The result is evaluated as follows:

All competitors with the same CLUB are members of a team. Their individual results are used to evaluate the relay race result. Each competitor performs a complete part of the competition with a start, finding transmitters and finish.

## ***Relay race***

## ***Chinese rules***

## ***Any category***

[See detailed description](#) 

## **Run Time List**

The list of runtimes shows several data and statistics of the individual competitors, of the competitors within the same category and of all competitors compared to each other. The list is divided into the following sections:

- Data concerning the competition itself (as in other lists as well)
- The shortest distances of all categories are calculated. If HTML format is used a graphic for the category with the longest distance is created as well.
- Data concerning each competitor (sorted by start time): Search order, start time, time at the transmitters, finish time
- Data concerning each competitor (sorted by category and rank): Search order, in minutes the times between the start and the transmitters and the finish line and cumulative times from the start to the transmitters in min:sec.
- For each category the statistics of the 'transmitter-to-transmitter' times in min:sec
- For all competitors the distribution of the arrival times at the transmitters within the 5-min-transmitting scheme (divided into sections of 30 sec)

- Distribution of the arrival times at the transmitters divided into sections of 10-min (including start and finish)
- List of competitors who might have collaborated within the competition. The collaboration is calculated based on their arrival times at the transmitters being almost the same (differences of 20, 30 or 40 sec). The competitors are listed one below each other.

### ***Text***

Creates the run time list in a simple text format.

### ***HTML***

Creates the run time list using HTML tables and CSS layout, select by user.

The start, transmitters and finish are listed in the order they were found. The time data is separated by a hyphen. If there are other or additional characters they have the following meaning:

- \* Transmitter was found but is not taken into account because it's not in the list of transmitters to be found by this category.
- # Transmitter was found more than one with a time difference > 1 minute
- + The timestamp is out of the range of the start and finish time (must be checked)
- ? Timestamp is not valid (must be checked)

## **Search Graphics**

All competitors of each category who have choose the same search order are listed with their result. On the left side a graphic is displayed. The graphic shows the distance in a straight line using the given search order.

### ***Text***

Creates the search graphic in a simple text format. The graphic is displayed with special characters and pseudo graphics.

### ***HTML***

Creates the search graphic list using HTML tables and CSS layout, select by user. The associated graphics are stored in the same directory as the list itself.

## **Individual Lists**

This list shows an extensive evaluation of the results of a competitor. The result of the competitor is compared with the other competitors of this category.

### ***Marked FH***

The individual ranking for the selected competitor is displayed.

**Text**

The individual ranking for the selected competitor is displayed in simple text format.

**HTML**

Creates the individual ranking in HTML format using tables. The associated graphic is stored in the same directory as the list itself.

**All FH**

Creates the individual ranking for every competitor. The format is using HTML tables. The associated graphics are stored in the same directory as the lists themselves. In addition to this a index page is created in two possibilities:

**Result link list**

The index page is a normal result list (ERG) with link on names of every competitor.

**Simple link list**

The index page is a simple list of names with link on names of every competitor.

**Start List**

Depending on the setting of the option dialog the start list is ordered by:

- Start times/start groups:used at the start
- Start numbers: used at the transmitters to log the competitors who found the transmitter
- Category and start time:used to check the raffle of the start times to avoid that the competitors of one start group are not ok to run together or if the competitors of the same categories are started with to short time intervals
- Club/Country and start time: helping clubs/countries to see they start times
- The first start time is only given once at the top, the start times of the participants start with the zero time

There is no CSV formatted file available for the start list. If a start list in CSV format is needed the list for the individual rankings can be used. It contains the necessary information.

**Start Information**

It creates a list that shows the transmitter to search for the individual categories and the time limit and contains two lines for the manual entering of the transmitter frequencies. In the text editor can be easily formatted to the size of an A4 page and the printed page will be posted at the start line.

**Start numbers**

The dialog that opens shows the options that can be selected. It is important to select the CSS layout that is requested afterwards. An HTM file is created that can be displayed and printed out in the browser.

If a background image is integrated through the CSS layout, this image file must be copied to the HTM file.

## **Finish Ticket**

The finish ticket all the data which is available at the competitors arrival. These are:

```
Name, club, call, category, start number, chip number, total running time,  
search order of the transmitters, run times, minimal track length,  
arrival time at the transmitters and the finish
```

As of V21.2, it now contains the competitor's place on the day of the competition with the time of the printout. See more details at the example of the [Finish ticket](#).

### **Marked FH**

The finish ticket for the selected competitor is printed on the defined printer.

### **At finish arrival**

Switch to set on or off the function of printing the finish ticket at the registration of the competitor at the finish. The printer has to be selected when switching on this function.

### **Running route graphic**

Within finish ticket the graphic of running route can be insert. The size can be change in INI file under [Ticket] with key word **tiZoomGraphic=** as zoom factor.

### **Portrait (def. Landscape)**

The finish ticket can be printed in landscape or portrait page orientation. The portrait format is useful for printers with narrow endless paper.

If the finish ticket is printed in portrait mode it is limited to a width of 40 characters. If it is printed in landscape mode the width can be limited by an entry in the INI file **tiWidth=**. If there are big numbers of transmitters line breaks are used to format the printout properly.

The formatting (font, fontsize, fontstyle) and the positioning of the printout (margins, blank lines at the end of the ticket) can be set in the INI file. The keywords are:

**tiFont=, tiTop=, tiLeft=, tiHead=, tiData=, tiTitl=, tiEndRow=**. With these parameters the tickets can be adapted to various paper formats and printers.

For more explanations and an example [see](#) .

Since version 6.7 FjwW supports also the Label-Printer **QL-500/550** of **Brother**.

Beginning from a label layout, which build with **p-touch-Editor** of Brother, finish tickets can be printed quickly. Also little graphics can be included. Further explanations [see](#)  and [QL-500](#).

## Check Com. per Cat & Club

In international competitions the number of **participants per category and country is limited in one competition**. According to the IARU-R1-WG rules, these are three competitors, on EYAC (youth) five. This is checked here, the last error is output in the message box, all errors are listed in the LOG file.

## Detailed List

All details available about the competition and the competitors are printed in a table format. The details are:

```
Rank, name, club, call, run time, number of transmitters,  
start number, chip number, start time, finish time,  
times at the transmitters, Error code, Correction code,  
transmitters not taken into account (found but not counted) are listed after the categories and rankings.
```

After the transmitter times the following indicators can be shown:

- \* transmitter found but not taken into account because the transmitter is not in the list of transmitters (for this category)
- # Transmitter was found more than one with a time difference > 1 minute
- + transmitter time is not within the start time and the finish time of the competitor but it is within the time of beginning and the time of end of the competition. This has to be checked. The transmitter is NOT taken into account.
- ? the registered transmitter time is not correct. This has to be checked. The transmitter is NOT taken into account.

The helpers and other information about the competition is shown in the list.

## Rent Chip List

All chips that have been marked as borrowed are printed in this list. The list is sorted in ascending order. It makes it easier to collect the borrowed chips at the finish. The chip of a competitor can be marked as borrowed while the competitor is registered or corrected. Within the TLN file the chip is marked as borrowed if it is preceded by an asterisk ("\*").

## JSON file

For special Internet applications a file in JSON format can be created. The used [Key words](#) can be find here.

## Certificate series printing

For the current competition a temporary CSV file with results for this moment is created. After selecting an existing layout file (\*.lay) the program **FjwLay** is called. As parameters the two file names have to be used and added. Within FjwLay (independently from FjwW) you can print a single diploma or series of diplomas (see details within FjwLay and the related help (F1)).

## Multi competition list of rankings

Multi competition assessments can be done with FjwW. For this purpose all required competitions must be loaded with their respective TLN/KOR/DAT or EDA files (up to 32). To select which of the loaded competitions will be taken into account must be determined in the menu **Results|Options of lists/Contest select** .

To calculate the results for a multi competition assessment the competitors are identified by name + first name. These have to be unique and identical in all competitions to evaluate the correct result.

To learn more about the details of the structure of the name [see](#) 

To be considered as one and the same competitor within different competitions the first six characters of the **Name** and the first six characters of the **Firstname** must be identical (regardless of capital or small characters).

To allow correct multi competition assessments the writing of the competitors name and first name have to be identical in all selected competitions.

## Cup Rating

For the selected competitions (two or more) the results of the competitor are summarized ([see](#) ). The total number of transmitters and the total of the run times are calculated. The ranking is done based on the total number of transmitters and the total run time. When as an option a small number of competitions will be given, the best results of this number of competitions will be produce the total result.

The cup ranking list shows the following information:

Rank, name, club, call, runtime and number of transmitters per competition plus the total runtime and total number of transmitters.

### **Text**

Creates the cup ranking in simple text format.

### **HTML**

Creates the run time list using HTML tables and CSS layout, select by user.

### **CSV**

A file with **CommaSeparatedValues** is created. It contains all relevant data for result calculation. This format can be imported by programs like **FjwLay** or **Word / Excel / Access**.

The CSV file contains the following data for each competitor:

```
Category, rank, name, first name, club, call,  
total runtime, total number of transmitters,  
run time 1, number of transmitters 1,  
run time 2, number of transmitters 2,  
.....,  
run time (n), number of transmitters n(n)
```

### **RLL Rating (DARC)**

A list is created following the [Racing system of the DARC](#). The parameters about the competitions to be taken into account are configured in the menu

**Results|Options of lists|Special** (top left corner). In this window the maximum number of competitions (default=4) and the number of competitions for the result evaluation (default=3) can be defined. The difference between the maximum number and the number to calculate the result are ignored.

For the selected competitions (two or more) the results for each competitor are combined together ([see](#) .

If two competitors have the same amount of ranking points, their rank is evaluated by taking into account the ranks of the competitions taken into account (the ranks of the competitions are added as the times and number of transmitters). The competitor with the lower value is first.

### **Text**

Creates the above described list in a simple text format.

### **HTML**

Creates the run time list using HTML tables and CSS layout, select by user.

### **CSV**

A file with **CommaSeparatedValues** is created. It contains all relevant data for result calculation. This format can be imported by programs like **FjwLay** or **Word / Excel / Access**.

The CSV file contains the following data for each competitor:

```
Category, name, first name, club, call,  
total points, total points 144MHz, total points 3,5MHz,  
points for 1st 144MHz competition, points for 2nd 144MHz competition,  
points for 3rd 144MHz competition, points for 4th 144MHz competition,
```

points for 1st 3,5MHz competition, points for 2nd 3,5MHz competition,  
points for 3rd 3,5MHz competition, points for 4th 3,5MHz competition

## Club Rating (Romania)

This evaluation is applied in Romania. For every competition the participant receives up to 100 points. These points are added for all participants of the same club and the clubs are sorted according to the score.

Removed in IARU Rules 2017 !

### ~~C&heck Com. per Cat & Club~~

~~For international competitions the number of **competitors per category and country**, which can start in **all competitions**, is limited. According to the IARU R1 WG rules, there are a total of six competitors. This is checked here, the last error is output in the message box, all errors are listed in the LOG file.~~

## Start Statistics

With this option an evaluation about the repartition of start times within the opened competitions can be done. For each competitor the multiplicity with which he was positioned in which part of the starting list is calculated. The start period is divided into 10 sections (each representing 10% of the time period). The start time of the competitor is associated with one of the 10 sections.

One and the same competitor is defined as usual ([see](#) ). The list is sorted by category and the RLL ranking within the category.

## Diploma Points (Germany)

With this list the points for the DARC ARDF diploma can be calculated for the loaded competitions. The competitors and helpers are sorted by total points.

The points can only be calculated correctly if the following data of the competitions and of the competitors, helpers and organizers are set correctly:

Type of competition **OFF, INT, OV**

Helper / organizer **HLP, ORG**

Peilmeister **FM**

The diploma points are calculated following the schema described [here](#) .

## **Medal Statistics**

For every Club/Country the number of medals (places 1./2./3.) will be add for Single or Team rating.

## **Participation Statistics**

An HTML list is generated that shows the number of competitors in the categories of all participating DOK/clubs/countries of all invited/selected competitions.

## **Multi list, FTP   Ctrl+M**

To generate more/always the same current results lists/files, this function can be used. For this, a directory must be specified, in which all files are stored. This is done every time even after you click **OK**.

The specified files can be uploaded via FTP once/cyclically to a specified FTP server. Further details [see](#) .

# The Interface menu

## SportIdent

### **SportIdent** Ctrl+I

In this window the following settings for the SI stations have to be configured correctly:

- Combo boxes to choose the number of the **serial interfaces** (SI-A, SI-B, SI-C), to which SI stations are connected, the first 99 available COMs can be selected.
- Selection of the transfer rate of the serial interface. The SI stations with RS232 (V24) interface use 4800 or 38400(>=BSx7) bps. The SI stations with USB interface use 38400 bps. After 1-2 seconds the program tries the no selected transfer rate if the wrong transfer rate is selected.
- Cycle time in which the station is polled.
- Additional functions can be selected for the SI-B, which are described below.
- The SI-C can read data coming from start/fox/finish stations.
- **Display cards only, not evaluate !** has to be activated if the content of the cards should only be displayed and not taken into account for any competition and should not be stored in any KOR file; is already active, when using SI chip registration.
- The competition begin time is very important if data of SI-Chip5 will be read from a station. For "Two days competitions" here must be entered the date of first day !  
They are only not taken into account for the **Stations Service....**  
In this case the date and time must be unequal to 0.
- With click on **Refresh port list** the available COM ports are scanned again, e.g. a serial-USB-adaptor, which connected during open dialog, will be visible then and can be selected.

The **SI-Chip5** can only hold time stamps with an 12 hours format. The timestamp can be one of two times of a day (6am vs. 6pm). Therefore the begin time of the competition is taken to evaluate which of the possible times is the right one. ~~To do this the correct setting of the **Date** and **First time** is needed.~~ The date is just added to the time stamp read from the SI-Chip5. The first time is used to determine whether the timestamp in the afternoon or the morning. This does not matter for the newer chips.

If two competitions take place on the same day and both of them are loaded into FjwW the data read from the chip (or station) is taken into account for both competitions. The data is written to both KOR files. In the case the end time of the first competition and the beginning time of the second competition overlap, this can lead to problems!

Using the three interfaces SI-A, SI-B and SI-C different tasks can be achieved:

**SI-A (SportIdent-Interface A):**

- Reading the data of the SI cards for the competition
- Reading of the SI chip numbers for the registration
- Backup of data of the directly attached SI station (master)

**SI-B (SportIdent-Interface B):**

- Reading the data of the SI cards for the competition
- Reading of the SI chip numbers for the registration
- Backup of data of the directly attached SI station (master) and indirectly attached SI stations (slave)
- Service functions (programming of stations) of the directly attached station (master) or indirectly attached stations (slave). SI cards are not read or used for the competition result evaluation
- Reading of data sent by a start/fox or finish station when a SI card is inserted. The station must be in AUTSEND mode for this option, the **Fox** stations have to have station **numbers 20...254**, the **Start** station the **number 3** and the **Finish** station the **number 4**.

The data from a fox station will arrive via a radio transmission on a real competition. The radio transmission itself must be transparent for the data. The transfer rate of SI-B can be set to 1200 bps for this purpose, other baud rates (e.g. 2400 bps) by set this value in INI file with **foxdataBaudrate=2400**.

### **SI-C (SportIdent-Interface C):**

- !only! Reading of data sent by a start/fox or finish station when a SI card is inserted. The station must be in AUTSEND mode for this option, the fox stations have to have station numbers 20...254, the start station the number 3 and the finish station the number 4.

The data from a fox station will arrive via a radio transmission on a real competition. The radio transmission itself must be transparent for the data. The transfer rate of SI-B can be set to 1200 bps for this purpose, other baud rates (e.g. 2400 bps) by set this value in INI file with **foxdataBaudrate=2400**.

### ***Backup/Display data*    Ctrl+B**

The dialog enables the backup of the time stamp data stored in the SI stations. The data is written into a \*.DAT file and are appended to an existing file. The name should not be changed in order to keep the relationship to the loaded TLN file.

The time stamps of the SI-Card5 are only unique within 12 hours, the competition date is always added, the time remains unchanged between 0.00:00 and 11.59:59. The conversion to the pre-/post-noon time is only carried out when the competition start time is read in.

The time stamps of the SI card 6...11 and SIAC are only unique for a period of four weeks. The competition date is added if the day of the week on the timestamp matches the day of the week on the competition date. Otherwise the abbreviations of the time stamp day of the week appear in the date and after a # at the beginning of the line, making this data line ineffective.

The data in an SI station should not be older than a week, otherwise

the data may be ambiguous and must be edited manually afterwards. Examples of [Backup-Data-Files](#).

During the backup the SI station numbers are translated into transmitter numbers. For this translation the table located in the center of the dialog is used. The table can be the standard table which calculates Transmitter number=Station number-30 or a modified table which is used within a special competition. In the later case the competition has to be selected in the select box. ~~In the select box only competitions with the same date as indicated in **Interface/SportIdent** are displayed.~~ If the data read from the SI station contains unknown SI station numbers, they are written into the DAT file as Transmitter number=Station number+1000.

If the memory of the SI station should be cleared after the backup the checkbox **Erase station after backup** must be activated. After backup it is possible to switch off the SI station on SI-B only.

While the backup is running a small animation is displayed together with a blinking indication telling:

**It has to be assured that no SI chips are inserted into the SI station while the backup is running !!!**

If this is not done the backup will be incomplete and might lead to a loss of data.

In the left part of the window the data read from the station can be displayed. After selecting a card number and a transmitter number/start or finish entry, the time stamp for this card number are displayed with the station number and the resulting transmitter number.

### **Station programming**    **Ctrl+P**

The most important setting for the SI stations can be done here, if the communication with the connected SI station is correctly setup and running. The following settings can be changed:

- Function of the SI station (Clear, Check, Start-, Finish-, Read station, Foxes; programmed with station numbers 1, 2, 3, 4, 5, >=20). Stations for transmitters have to programming with SI station number **20...254** (e.g. F1=31, F2=32, ... F5=35). The signalization is always set to LED flash and sound ON. The data within the station are **erased!** The station is switched off after it has been reprogrammed.
- Setup of the operation time and the Autosend mode for the so called **trainingsmode**. The station is switched off after it has been reprogrammed.
- Set the internal clock of the station based on the clock of the PC/notebook.
- Switch of the SI station

Together with the service dialog the status window of the SI station is displayed. In this window the settings can be controlled (eventually after switching on the station again)

More settings can be performed only with the **SI-Config Plus** (old SI-Config) provided by AES (Download: [www.sportident.com](http://www.sportident.com)).

## Display results

### ***Result display***

In this dialog the sending of results via the serial interface (COM) or the LAN (using TCP/IP) can be set up. The competition can be selected. For more details see [Display of results](#).

All available serial interfaces are listed in the combo box. The number of LAN port is define in the INI file. The list box show all URL's under which the FjwW HTTP server is reachable.

***DisplayPC clear, send again***    **Ctrl+V**

Using this option all categories are sent to the DisplayPCs. This can be necessary if the software FjwWdispl was restarted, the network link was disturbed and old displays on the DisplayPC are to clear.

## Signal+Speech

### ***Start signal***

For **all** loaded competitions where the date of competition is the system date some acoustic signals can be activated (similar to the time signal known from the radio/TV). The signals can be setup for the start of the competitors or independently from the start times in periodic intervals (every x minutes).

The seconds at which a sound should be played can be configured (e.g. 10, 5, 4, 3, 2, 1 second before the start; possible 60,45...1). At the start time a special sound is played. The way of creating the sound can be setup in the dialog itself or by some keywords in the [INI file](#).

For more details [see](#) .

### ***Speech output***

If a **TextToSpeech** processor is installed on the PC (see details) it can be activated and used for some actions:

- announcement of the competitors starting next (the time before the start can be set up)
- announcement of the result of the competitor after his chip was read in the reading station
- announcement that the chip is a borrowed chip (this helps to collect them after the competition)
- announcement of the first name, name and call of the selected competitor in the result list with menu

***Extras | Announce name & call***

Before each announcement a signal can be issued to attract attention to the announcement.

For more details [see](#) 

### ***DCF/GPS synchronization***

A correct time setting is necessary if FjwW creates the start signals or if the transmitter stations are setup for the competition. A DCF or GPS receiver can be connected to the COM or USB port of the PC to set the clock correctly. The DCF/GPS receiver allows the synchronization of the time and, if the GPS receiver is used, the display of GPS position of receiving. The **DCFGPSvdb** is a standalone application which must be run with the corresponding options. The software must be located in the FjwW program directory.

To learn how to use the program **DCFGPSvdb** and how to connect the DCF receiver to the COM port [see](#) .

=====

### ***Automatic feature start***

In the five dialogues

**SportIdent Interface - - Result display - - Start signal - - Speech output - - Finish ticket print**

when the settings are confirmed with OK, they are always saved in the registry.

If one/more of these submenus are activated, the next time FjwW is started and a competition is loaded, the last settings from the registry are loaded into the corresponding dialogs and automatically confirmed immediately. This possibility is particularly valuable within a competition with many participants if the program was terminated for any reason (including a program crash). Then the program with all its features can be put back into operation quickly. When working with 'Several instances with FjwW', these submenus are disabled

because the 'Automatic Feature Start' no longer works correctly. After installing version 20.10: When one of the dialogs is opened for the first time, the values saved in the INI file are adopted in the dialog and, after confirmation with OK, are written to the registry and are also adopted from registry the next time the dialog is opened, the corresponding INI values are now irrelevant more.

=====

## Finish timekeeping

### ***Manual finish timekeeping...***    Ctrl+T

In the time taking window the actual time can be stored by pressing the space bar or by a mouse click. The times, which are stored are kept on a stack. The latest time is on the top. The former times are below in the list. A maximum of 10 times can be stored in order to be attributed to the competitors. If more times are taken, the oldest ones are lost. The times can only be attributed to competitors of the selected competition. If more than one are loaded the right one has to be selected before attributing the times. The selected competition has to have the actual date as the date of the competition. If this is not the case the label "**Start No Name**" the background color of the time taking window becomes **red**.

Further details see [\*\*The Finish timekeeping window\*\*](#)

# The Extras menu

## **LOG File**

The display starts at the end of the LOG file. From here you can scroll up to the beginning of the file.

Certain activities and errors are appended to the log file. The current log file has the name **~FjwW.log** (it is located in the subdirectory, which can see or change after menu

**File|Options|Path for LOG file** ). The size of the log file is automatically truncated to 200 kB. When the limit is reached the log file is renamed and a new log file is created. The renamed log files have increasing numbers. The files can be deleted if they are not required any longer.

## **Show LO&G/TLN/HTTP/FTP path**

The directory was created automatically when FjwW was started for the first time. But it can be changed via menu

**File|Options|Directory for LOG/TLN/HTTP/FTP files** .

The window that opens shows the LOG file (~FjwW.log), if applicable old LOG files (~FjwW???.log), data files (~FjwW\_\*.dat, time stamp of read SI chips), TLN files of newly created competitions and subdirectories HTTP and FTP.

=====

## **Cyclic backup TLN/KOR**

For cyclic backup (prevention of data loss in a crash) changing TLN and KOR files during a competition, this feature may be used. In the dialog the drive/directory is specified, in which the copy number of the TLN/KOR files of the **current competition** will be stored. Repeating the backup is done with the input cycle time when at least one of the files has changed. The files have a file extension **~00~**

ascending to ~??~. The question mark will be determined by the input copy number. When reached, the oldest copies (if the ~00~) overwrite it. The backup runs as a separate process in a Command Prompt window, by closing the window the backup will be finish.

### ***Opt. Searching Orders***

The optimal search sequences for all categories are displayed in a window [see also](#) 

### ***Announcement data***

When the speech output is activated, the first name, name and call sign of marked competitors will be announced.

=====

### ***Several FjwW instances***

If this menu item is activated, each starting FjwW leads to another instance of the program. The then running FJwW programs are completely independent.

Normally, a new competition will be load in the 'File' menu, by double-clicking or drag&drop a TLN file in the one running FjwW. If on a competition day two temporally overlapping competitions (end time of the first is later than the beginning of the second competition) are to be evaluated, it may cause problems with the results. If the data of SI cards are read, FjwW writes the data to all KOR files of the loaded competitions. Further details [see](#) .

To avoid the problems associated with time overlapping competitions, load the competitions in various instances of FjwW. This required to think about the used hardware resources (COM ports for SI-stations, LAN ports for network support, ...) of the computer, because they can't be shared between the FjwW instances.

### ***Associates with FjwW***

The following settings are done:

- In the start menu of Windows a icon to start FjwW is created below the **Program** group with name **ARDF-FjwW**. Quick start is possible by keys **Ctrl+Alt+F** .
- The file extensions **.TLN** and **.EDA** are linked to FjwW. Double clicking on files with these extension will automatically load into FjwW as a separated competition.
- The TLN and EDA files get a special icon.
- The path to access the **Help file** in the directory of FjwW is set.
- In the context menu **Send to** of the explorer a **ARDF-FjwW** is created. By using the right click a TLN/KOR/DAT/EDA can be easily sent to FjwW and loaded.

### ***Save settings***

The settings are always saved in the **FjwW.ini** file. This file is always located in the program directory of **FjwW**. If no INI file exists it is automatically created. The following settings are saved:

- Size of the main Window at program start
- Order and width of the columns of the result list in the main window
- Font, size and color in the main window
- Options for loading the TLN/KOR/DAT files (automatic loading of KOR/DAT)
- Option concerning the auto save of the TLN-BAK file
- 'Tool tip' and 'colored background' setting
- ~~Name of printer of finish ticket printing~~
- ~~Option for Portrait/Landscape of finish ticket printing~~
- Displaying style of Runtime

An example on an INI file can be seen [here](#) .

### ***Show/Edit INI file***

The INI file belonging to the running program is opened and can be viewed, changed and saved.

## ***Own HTML display***

If the option is activated, after creating(+ displaying) an HTML list a FjwW window will be opened and the HTML pages will be displayed, otherwise the selected default browser of the PC will be used for display.

## ***Language program***

All implemented languages are displayed. If the correct language-DLL is present in the program directory of FjwW the related language can be used. Changing the language requires a restart of FjwW to be taken into account!

If the language-DLL is no available, FjwW will start always with the German language.

## ***Language lists***

After selecting the **Language program** and restarting FjwW, the **Language lists** are set to the same language. After that, it can be changed to another language. This causes all output in result lists and displays(DisplayPC, Finish ticket, HTTP server) to be generated in that language.

The lists language can be changed without restarting FjwW.

## The View menu

The Shortcuts

**Ctrl+F2, Ctrl+F3, Ctrl+F4, Ctrl+F5, Ctrl+F6** are available as soon as a window of FjwW gets the focus.

***Comp. data Window***    **Ctrl+F2**

Sets the focus to the window which contains the data for the competition and brings it to the top. After activation the window can be used to modify the data as requested [see](#) .

***SI status Window***    **Ctrl+F3)**

Sets the focus to the window which contains the status information of the SportIdent devices [see](#) .

***Registration Window***    **Strg+F4**

The dialog, in which participants are registered (inserted into the current competition), is brought to the foreground, [see](#) .

***Text/Edit Window***    **Ctrl+F5**

Sets the focus to the window for displaying and editing lists and brings it to the top [see](#) .

***HTML Window***    **Ctrl+F6**

=====

***Refresh***    *Shortcut F5*

The table with the results in the main window is refreshed (normally this should not be necessary).

## **Font of Table...**

Set the font, size and color... for the results in the main window.

## **Optimal column width**

All columns of the results in the main window becomes so wide to see unabbreviated text. When this option is activated the currently width of columns will not be saved in INI file (menu

**Extras|Save settings** ).

In the result list the width of the columns can be changed by moving the separations lines between the headers of the columns. By this they can be reduced to a width of 0 (and they become invisible). The order of the columns can be changed by moving the headers of the columns to the desired place.

## **Runtime in h:mm:ss**

Switch the display of Runtime in windows and result lists from mm:ss to h:mm:ss.

=====

**Next category**    **Ctrl+Cursor right** (useable in all FjwW windows)

**Previous category**    **Ctrl+Cursor left** (useable in all FjwW windows)

Can be used to select the next or previous category in the result list of the main window. The first nine categories can also be accessed using the *Shortcut* **Ctrl+1...Ctrl+9**. The shortcuts are usable when any FjwW window is active.

**FH finished**    **Ctrl+Z**

The arrival list displays the competitors already arrived at the finish. The competitor who arrived most recently is displayed on the top.

The card number of lent SI chips are marked with an asterisk. They can be easily identified at the finish. This enables the organizers to demand back the lent chips.

***FH still on the way***    **Ctrl+A**

The list of running competitors displays those competitors not yet started or not yet arrived at the finish. The start groups are separated by a blank line. Five minutes before the start time of a start group is reached the competitors which will be starting are checked.

***Not registered SI chips***    **Ctrl+Q**

The list shows the SI chip numbers with which no competitor is registered in the loaded competitions. The time when data was read from this chip number is entered in the **Diverse** column. When the competition is closed, existing chip numbers in the list are saved in the LOG file.

***Helpers***    **Ctrl+H**

The list displays the registered helpers in alphabetical order.

***FH/Help deposit***    **Ctrl+C**

The window show the no active participants/helper, which have no any meaning for the competition. They will store in the TLN file. The line begin with the "\$" character always.

***Next competition***    **Ctrl+Cursor down** (useable in all FjwW windows)

***Previous competition***    **Ctrl+Cursor up** (useable in all FjwW windows)

If more than one competition is loaded they can be easily accessed with these keys. The first nine competitions can be accessed by

using the **Ctrl+Shift+1 . . . Ctrl+Shift+9** as well. The shortcuts are usable when any FjwW window is active.

## Preparation of the data for a competition

There are several possibilities to create a competition within FjwW:

- Menu **File|New Contest**

A competition with some default settings is created. The defaults include one competitor with the category “no category”. In the competition window these settings can be completed and/or modified.

Via **Edit|FH/Hlp Registration** the competitors can be added.

Via **Edit|FH/Hlp delete completely** a competitor can be deleted from the competition.

Via **Edit|Correction FH/Hlp Data** the data of the competitor can be modified.

These functions are also available in the result menu doing a rightclickdisplay

- Copying and modifying the template **\_beispiel.tln**. Copy and rename the template to something like **20060101.tln** (using the date as a filename is a very good idea) All data within the upper area of the file should be changed to the good values for the competition to be run. The keywords and key lines starting with **@** are not allowed to be changed.

The lines used for the competitors can be replaced by empty lines or the correct data for the real competitors can be entered. The existing lines can be used as examples. They must be deleted before loading the file. The data has to fit within the columns given by the keywords. If this file is opened with FjwW and no error messages are displayed the application is ready to be used (two windows will be available).

- The same procedure as before can be applied with the files **\_beispiel1.rtf** or **\_beispiel2.xls**. In this case WORD or EXCEL can be used to modify the data. After all modifications are done just select all text or the whole table and copy it to the clipboard.

In FjwW the data is loaded using the option  
**File|TLN Data from Clipboard** .

- Load the file **\_default.tln**. The modification of an entry can be invoked by a double click or by **Ctrl+F6** or by the context menu. The necessary data can be modified. By using **Edit|FH/Hlp Registration** a dialog is opened which allows the selection of competitors based on a file called 'Namensliste.txt'. This file is delivered with FjwW. A lot of known ARDF competitors are included in this file. With a few clicks a new competitor is inserted into FjwW.
- For competitions which are similar at each time a TLN file can be prepared. If those competitors are included who “normally” attend the competition it’s very easy to go on. Competitors included in the initial file who do not come are simply deleted (if you want). As they are never shown in the result lists they can be deleted at a later time. In the prepared file you can set the category to **aK!**. The correct category is set when the competitor arrives. After the arrival of all competitors those remaining **aK!** Can be deleted easily.

After creating the competition and adding or modifying the competitors the file should be saved by **File|Contest File save** or **Ctrl+S**. If modifications have been done a KOR file is automatically created. The KOR file has the same name as the TLN file.

#### **The starting times are set as follows:**

- By manually writing them into the column **START** within the TLN file
- By manually setting the start group in the column **SET** within the TLN file  
Example: **\*5** if the competitor should start in the 5th start group)
- By setting the start time in the related dialog  
( **Edit|Correction FH/Hlp Data** or **Ctrl+F6**)

- ~~By using the desired values within the **@START\_BALLOT** area of the TLN file (see the detailed description of the file **\_beispiel.tln**).~~

~~If the first number is greater than 0 the start times are calculated at the next start of FjwW. The number is immediately reset to 0 after the times have been calculated in order to avoid a new calculation at the next start. The calculated start times are saved into (or appended to) a KOR file which has the same name than the TLN file.~~
- After loading a TLN file by using **File|Balloting Start Times** . The dialog allows the setting of some parameters for the automatic raffle of start times. The random calculation of start times can be influenced by using the SET entries in the TLN file. The calculated times are saved into (or appended to) a KOR file which has the same name than the TLN file.
- By taking into account a time stamp from a SI-Start-Device which can also be a normal device at a transmitter. To use this option the parameter **@STT\_IN\_DAT** must be set to 127 or 1...62 depending on what is used. Also the competition data window can be used to modify this entry. In the field **Start times from** the wanted choice can be done. If the TLN file already contained some start times, these will be deleted. Using this way of setting the start times does not enable FjwW to show the correct run times (**xxx:yy run**) as the start time is not known as long as the competitor has not finished his run.
- by connecting a AUTOSEND programmed start station to the COM-B interface and setting in menu **Interface|SportIdent COM B Port / COM C Port** activate and **Start/Fox/Finish data reading** . The starting times will be read in immediately after punching SI chip in the start station and will be rounded not or to full 1, 2, 2.5, 5 minutes.
- If the **@STZ\_IN\_DAT** parameter is set to 255, the arrival time at the first fox found will be taken as the start time and this arrival time will be increased by 1 second as the fox time. In the competition data window, select "First fox found" for **Start times from** .

The TLN file can be loaded and modified with the integrated editor of FjwW ( **File|File Display/Editing** ). The modifications can only be saved if the file is not used by FjwW. The file can be released by **Edit|Remove Contest** . After saving the TLN file it has to be reloaded.

Attention: If the name of the TLN file is changed the related KOR file will not be loaded any longer unless it's also renamed according to the TLN file.

## Registration of competitor data with MS-EXCEL

For ARDF events with a high number of participants, such as the ARDF World and IARU Region1 Championships, there is a considerable amount of time required to register the participant data necessary for carrying out the competitions.

The following data must be provided by the competitors or participating countries:

- Surname and firstname
- Year of birth (control of the start authorization in the selected categories)
- Own SI chip number
- Amateur radio call sign
- Chosen category for each competition
- Chosen starting third for each competition (balloting start sequence for WC and IARU-R1)

The organizer shall provide the following data:

- Country name, preferably the abbreviations of the **IOC** with three characters [see](#) 
- Start numbers
- SI rent chip numbers for participants who do not bring their own

This data can best be captured, managed and modified with MS-EXCEL.

The EXCEL file could appear as shown in the file **\_WC-Registry.xlsx** included in the directory **examples** and shown in the following image:

1	CLUB	STNO	CARDNO	NAME	FIRSTNAME	CALL	BIRTH	CAT	Yes2	Yes3	Yes4	SET	Start2	Start3	Start4
2	#Country	StNo	SI Chip	Surname	Firstname	Call sign	Birth year	Foxoring	Sprint	Classic	Classic	Foxoring	Sprint	Classic	Classic
3	#BEL							4.9.2016	5.9.2016	6.9.2016	8.9.2016	4.9.2016	5.9.2016	6.9.2016	8.9.2016
4	BEL	42	443192	Van De Keere	Maurice	ON6VK	1938			M70	M70			1	2
5	BEL	43	303572	Crispijn	Erik	ON4ZG	1933			M70	M70			2	1
6	BEL	44	235700	Verhoeven	Johny	ON4VJ	1953			M60	M60			2	3
7	BEL	45	420921	Vanhalst	Marc	ON6HI	1948	M50	M60	M60	M60	2	2	3	2
8	BEL	46	254074	Van Britsom	Marc	ON4FOX	1966	M50	M50	M50	M50	1	1	1	1
9	BEL	47	1029274	De Rocker	Patrick	ON7ARQ	1951	M50	M60	M60	M60	1	1	1	1
10	BEL	48	254071	De Rocker	Kris	ON3KDR	1981	M21	M21	M21	M21	1	1	1	1
11	BEL	49	303594	De Rocker	Maarten		1986	M21	M21	M21	M21	2	2	2	2
12	BEL	50	332607	Kasimov	Faid		1971	M40	M40	M21	M21	1	1	1	1

For each participating country such a worksheet should be created with the IOC name of the country (in the picture Australia & Belgium). The first line contains keywords (highlighted in yellow) that are required when importing the data into FjwW. Data columns, which are not yellow, have no meaning during the import. This is exploited by successively replacing the column names **Yes2/3/4** by **CAT** and **Start2/3/4** by **SET** before the export/import for the four competitions on 4./5./6./8.9.2016.

Lines 2 and 3 are comment lines (by '#' as the first character) to explain what is to be entered in the data columns. From line 4 the data sources of the participants are displayed.

The SI chip numbers can be marked with a leading asterics "\*" as rent chips.

If you specify "\$\$\$" in the Category column **CAT**, the participant is transferred to the deposit of FjwW and can be so easy before/during the competition and subsequently entered into the competition.

Before exporting to FjwW, export all worksheets as "**Unicode Text (\*.txt)**". This can be done most easily with the macro **AllCSV** contained in the EXCEL file.

Now you can import all CSV files (Multiple selection is possible) in FjwW under Menue **File|Import competitors from CSV** . In the LOG file **CTRL+G** you will find error messages.

## Rating on Sprint competitions

### Extract from **ARDF RULES - Part B / 2015 - valid from January 1st, 2015** Appendix 7: Rules for the ARDF Sprint Competition

S3 Race system

S3.1 The competition shall be run as two loops with a spectator run through the finish area between them.

S3.2 Each competitor runs through the start corridor, which leads to the area with transmitters No.1 to No.5 (slow keying). After finding all the required transmitters from this loop, he/she runs to the spectator control and through the spectator corridor to the area with transmitters No.1F to No.5F (fast keying). After finding all the required transmitters from this loop, the competitor runs to the finish beacon and through the finishing corridor to the finish line.

S3.3 The transmitters searched for on each of the loops are defined in advance but may be visited in any order. All transmitters searched for on each loop shall be on the same frequency.

S3.4 The finish beacon and the spectator control may be at the same place. In this case, there is no spectator control transmitter.

The problem is to count the to rated transmitters, when the described order (above) of transmitters is not respected. This will only be executed, when the checkbox "Sprint" in the Competition data dialog CTRL+F3 is activated! To the special settings in FjwW [siehe FAQ17see](#) and [siehe FAQ18see](#).

#### FjwW count the punched transmitter as following:

1. Because of failure in following the right order of searching already brings disadvantages, the competitor should get the highest fox number, when several variants 3) and 4) as described below exist.
2. The search of spectator is an important criterion in determining the variants of order.  
The spectator may once, several times, not be punched, or not be present in the competition.
3. Once/several times the spectator punched:
  - Only a spectator is respectively taken as punched and the counted fox number in the both loops(slow/fast) will be added.

1	2	S	2F	3	4	S	1F	2F	3	S	3F	4F	B	punched transmitter
=====														
1	2	S	2F	-	-	-	1F	-	-	-	3F	4F	B	=8 rated transmitter
1	2	-	-	3	4	S	1F	2F	-	-	3F	4F	B	=10 <b>rated transmitter</b>
1	2	-	-	3	4	-	-	-	-	S	3F	4F	B	=8 rated transmitter

- If competitor start with a fox from loop(fast), only the foxes from this loop will be count  
**or**  
only the foxes from loop(slow) will be count; a punched spectator will not be count.

```

1F 2F S 3 4 5 B   punched transmitter
=====
1F 2F - - - - B   =3 rated transmitter
- - - 3 4 5 B     =4 rated transmitter

```

4. No spectator punched:

- Is the first punched fox from the loop(slow), the foxes will be count until a fox from loop(fast) will be punched their foxes will be count now.

```

1 2 3 5F 5 3F 1F B   punched transmitter
=====
1 2 3 5F - 3F 1F B   =7 rated transmitter

```

- Is the first punched fox from loop(fast), which foxes are counted only.

```

3F 5F 2F 3 5 1 B   punched transmitter
=====
3F 5F 2F - - - B   =4 rated transmitter

```

5. Each fox/spectator/beacon will be count only once. If only Spectator and/or Beacon (not hidden transmitters) are punched, the competitor is not placed.

```

S B   punched transmitter
=====
- -   =0 rated transmitter

```

To characterize the Spectator as a special location in the fox lists of categories, the exclamation mark "!" (obligation fox) will be used. [see FAQ-17](#).

**Real examples**, in which the result according to the above rules only a few rated transmitter are:

```

1 3 2 4 3F 4F 2F 5F S B   punched transmitter
-----
1 3 2 4 - - - - S B     =6 rated transmitter

1 3F 4F 2F 5F S 5 B   punched transmitter
-----
1 - - - - S - B     =3 rated transmitter

```

With the "**Ranglistenlauf**" (RLL) system the best German ARDF competitors for each category.

The results of some special competitions are the basis for the selection of the German participants for international ARDF-competitions.

Therefore there is only the German version of the description [see](#) 

## Calculation of the PM-Diplom- / Peilmeister points

(German ARDF diploma)

For the ARDF diploma of the DARC the competitors of each competition can collect the following points:

(criteria: Start time > 0)

- **OV** competitions at the level of the OV  
Each participant earns one point. The first not being Peilmeister (= **FM**) earns 3 points and the second non PM earns 2 points instead.
- **OFF** Official competition as the German champion ships and the Ranglistenläufe  
Each competitor earns the following points:  
(Number of competitors in the same category *minus* rank of the competitor)  
*divided by* (5 *plus* rank of the competitor)  
*rounded down* to an integer  
*plus* the *Maximum* of (6 *minus* rank of the competitor) or (2)  
This (complicated) calculation takes into account not only the rank of the competitor but also the varying number of competitors within the category. The minimum of points to be earned is 2.
- **INT** International competitions  
Two points regardless of the ranking.

Helpers and organizers earn the following points:

- **OV** competitions at the level of the OV  
Helper **HLP** earn 1 point. Organizers **ORG** earn 2 points.
- **OFF** Official competition as the German champion ships and the Ranglistenläufe  
Helper and organizers earn two points if they are not FM. If they are PM they get five points.
- **INT** International competitions  
Helper and organizers do not earn any points.

**SORRY, in German only.**

Mit dem **SRR Ranglistensystem** sollen die besten Amateurfunkpeiler Russlands/Ukraine (und angrenzender Länder) ermittelt werden.

Die vergebenen SRR-Punkte werden nach folgenden Regeln ermittelt:

- Punkte erhalten die Teilnehmer, die alle für ihre Kategorie festgelegten Sender gefunden haben
- Der Erstplatzierte erhält 25 Punkte (Basis-Punkte), kann in der INI-Datei unter **[RatingRUS] basePoints=** anders festgelegt werden.
- Für die Nächstplatzierten reduziert sich die Punktzahl für ihre zusätzliche Laufzeit (in Sekunden) dividiert durch 300 (entspricht minus ein Punkt pro fünf Minuten)
- Die Punktberechnung wird auf 1/100 Punkte genau durchgeführt
- Wenn die Kategorie eine kleine, in der INI-Datei unter **[RatingRUS] minComInCat=** definierte Anzahl von Teilnehmern hat, erhalten diese Teilnehmer keine Punkte, außer:  
es gibt Kategorien mit vergleichbaren Anforderungen (gleiche Anzahl zu suchender Sender), dort wird sein Ergebnis eingeordnet und dann seine Punktzahl berechnet. Die Möglichkeit der Einordnung in diese Kategorien wird in der INI-Datei festgelegt, z.B.: ein einzelner Teilnehmer der Kategorie M60 könnte in die Kategorien M50, M40 oder M21 eingordnet werden.

Bei Wettbewerben der "B"-Kategorie (Club level, City level, the traditional):

- Die Wettkämpfer werden bei entsprechender Leistung in der Vergangenheit einer der folgenden "Klassen" zugeordnet:  
**ЭМС, МСМК, МС, КМС, I разряд, II разряд, III разряд, Iю., IIю., IIIю., б.р.**

Das sind Abkürzungen mit entsprechender Bedeutung wie "OMC = Verdienter Meister des Sports".

- Diese "Klassen" haben abhängig von der Kategorie unterschiedliche Gewichtungspunkte. Die Namen der "Klassen" und die zugehörigen Gewichtungspunkte werden mit mehreren Schlüsselworten in der INI-Datei unter [\[RatingRUS\]](#) **basePointsBcat= classW= classW1= classW2= classW3= classWeight\_???= ...** eingetragen.
- Bei einem Wettbewerb der "B"-Kategorie wird die Basis-Punktzahl des Erstplatzierten aus den Gewichtungspunkten der ersten zehn Platzierten in jeder Kategorie nach einer Berechnungsformel ermittelt.  
Basis-Punktzahl =  $12 + R5/100 + R5/200 + R10/400$  (R5 = Summe der Gewichtungspunkte der ersten fünf Platzierten, R10 = Summe der Gewichtungspunkte der ersten zehn Platzierten).  
Das ergibt eine mögliche Basis-Punktzahl von 13...24 Punkten für den Erstplatzierten.
- Die erreichbare Punktzahl in jeder Kategorie hängt also von der "Klasse/Gewichtungspunkten" und der Platzierung der Teilnehmer ab. Nach dem Erstplatzierten reduziert sich die Punktzahl entsprechend der höheren Laufzeiten.

The **FRR ranking system** is intended to determine the best amateur radio direction finders in Romania.

The GC points awarded are determined according to the following rules:

- The point determination is carried out for selected (younger, high-performing) categories:  
e.g. in the two groups W19, W21, W35 and M19, M21, M40 (determined in INI file under **[RatingROM]**)
- Regardless of this, two or more categories with the same stations to be searched for can belong to a group. But each category can only appear once in all groups. The group of categories is listed after the keyword **catGroup?** ("?" is a number 1..9), separated by a comma.
- Within these two category groups, the participant is determined who has found all the transmitter to be searched for and has the shortest running time based on the number of these transmitters. This participant receives 100 points.
- Participants who have found all transmitters and have a longer running time per channel receive inversely proportional fewer points; for example, with three times the duration per transmitter, a participant receives a third of 100 points => 33.33 points.
- Participants who have found one less transmitter receive points according to the following procedure. The one with the shortest running time per channel among these participants receives 20 points less than the one with the worst running time per transmitter and all transmitters found. All other participants will receive proportionately fewer points (as above).
- Participants with two or more transmitters not found and participants in other categories than those listed in the INI file will not receive any points.

The FRR Romania club rankings are as follows:

- Participants' GC points from multiple competitions will be credited to the participant's club and added together.

- Participants in the W15 and M15 categories who have found all the transmitter they need to search for will receive 25 points (determined in the INI file under **[RatingROM]**) for their club.
- The clubs are sorted according to their total points achieved.

## Evaluation of ARDF - Competitions with application of the power factor

**This model will only be used, if an evaluation with categories (less than 5 competitors for a category) isn't possible or if competitions for higher-order ones (e.g.: OE championship) must be counted.**

The international ARDF rules provides different competition conditions (categories, number of foxes to be looked for) to the consideration of sex and age. With this, among other things, a carrying out of competitions is reached under the same temporal framework.

At local competitions, sometimes there are not enough competitors for running in categories (at least 5 per category required!). So the evaluation is done only in a general category, which puts especially older participants and ladies in a strongly disadvantage.

The following model takes into account the performance differences proved scientifically (to Cepelka and Hanson) by multiplication of the actual running time by power factors simply to be used. The results of different sex and different age groups therefore get comparable. The suggestion orientates itself regarding to the age groups at the international ARDF rules.

.....

The model suggested by OE6TGD has 5 foxes to be found from all participants. The obtained running times will be multiplied by a power factor (Cepelka and Hanson) from the following table (responding to the age and sexuality of the competitor) to get the definite ranking:

In FjwW the women's categories are determined by the first letter 'W', the categories of men by all other first letters. With the key word **WomenCatFirstChar=** in INI file the first character of women's categories (z.B.: SLO -> **WomenCatFirstChar=Ž**, ROM -> **WomenCatFirstChar=F**) can be changed.

Age	Power factor Multiplier	
	M	W
to 19	0.91	0.83
19-40	1.00	0.91
40-50	0.91	0.83
50-60	0.86	0.78
60-65	0.80	0.73
65-70	0.75	0.69

The power factor of the ladies (W) is different to Cepelka by approx. 10% after Hanson by 8-10% of that one of Men (M).

In this preliminary draft 9% (mean average value) were taken into account for Ladies.

Upon the fact that the actually runtime is about 70% \*) of the measured time, only this part has to be multiplied with the LF, the rest is added up without any alteration.

\*) this value still has to be verified! OE6TGD/OE6GC, 13.11.2005

Precondition for using the power factor in FjwW are concerning entries in INI file under paragraph **[Rating]** with key words **powerFactorRun=**, **powerFactorMan=** and **powerFactorWom=**.  
example:

**powerFactorMan=0-19:66.66% / 20:99.5% / 21:100% /.../ 80-99:55.55%**

that means: the age group until 19 years with 66.66%, competitors with age of 20 years with 99.5%, competitors with age of 21 years with 100%, ..., the age group of 80 until 99 years with 55.55% will be rated.

For every age of 0 until 99 years there must be exist a value of percentage !

## Handling and behaviour of the SportIdent stations

The following description no longer deals with SI stations up to and including BSF/M 6. They can only deal with the older SI-Card 5/6, not with the newer SI-Card >=8. These stations should not be used anymore.

Typical station variants (Photos: ©SportIdent)

				
BSF7	BSF8	BSF9	BSM8-USB	BS11-BS AIR+
115*62*32 mm	101*51*19 mm	112*57*21 mm	101*51*19 mm	115*62*32 mm
137 g	62 g	85 g	62 g + Kabel	150 g
Start/Fox/ Beacon/Finish	Start/Fox/ Beacon/Finish	Start/Fox/ Beacon/Finish	Master: Read SI- Cards, Programming stations	Start/Fox/ Beacon/Finish AIR+

Quotes ©SportIdent:

- The BSF8 station is “always on” and works in a low power Stand-by Mode. There is no need to switch on the station or to make any special preparations before the unit can be used. Also in Stand-by Mode the station is fully qualified to proceed SPORTident-Cards. The maximal wake up time is 1 second but can be adjusted by the user. A faster wake up will increase station’s power consumption. The station is switched from Stand-by Mode to Active Mode when the first SPORTident-Card is inserted.
- Once the station is in Active Mode the reaction time to the insertion of subsequent SI-Cards is very quick. After an adjustable period without a SI-Card being inserted, the station drops back to Stand-by Mode.
- From Stand-by Mode the station can also be switched to Service Mode. This is done by switching on the station with the Service/OFF-Card. In Service Mode the station’s LCD display offers additional information like the serial number, battery consumption and firmware version, see below. Information about station’s battery is given both by measuring the battery voltage and by computing the station’s battery consumption in relation to the battery

performance. Service Mode is automatically terminated after 10 minutes or earlier if the Service/OFF-Card is used.

- SPORTident-Station BSF7/8/9 feature with an easy firmware upgrade mechanism. Station's firmware can be uploaded by the user via simple inductive coupling. This feature keeps the station up to date and enables the implementation of additional functionality. To upgrade the firmware a master station BSM7 must be used. Information about the firmware version and features are available at [www.sportident.com](http://www.sportident.com).

The stations each fulfill a special function as Clear/Check/Start/Fox/Finish stations. For these functions, they must be programmed using a master station (BSF/M 7/8) [see](#) .

Apart from the station number and time, further station-specific data are shown on the display. Examples:

<b>SERVMO</b>	Service-Mode, once after switching on with the OFF card
<b>CN 33</b>	Station number
12:13:14	Time
<b>OFF240</b>	Operating time in minutes
<b>SW 565</b>	Version of firmware
<b>BAT341</b>	Battery voltage in volts (3,41V), measured when switching on the station
<b>CAP011</b>	Used battery capacity in percent
<b>PC 35</b>	Number of stored SI cards

### Some selected data of Sportident stations

(Binding information only at [www.sportident.com](http://www.sportident.com))

- Memory for: 21802/1022 (BSF8/BSM8) SI-Cards in Fox-/Read-Station

## Feature/Handling of the SI cards

All SI-Card / Compass variants (Photos: ©SportIdent)

no longer deliverable 	no longer deliverable 						
SI-Card 5	SI-Card 6	SI-Card 8	SI-Card 9	SI-Card 10	SI-Card 11	SIAC(AIR+)	ComCard Up
30	64	30	50	128	128	128	30
330 ms	130 ms	115 ms	115 ms	60 ms	60 ms	60 ms	115 ms
12-h-stamps					LED	LED+Beep	right-left hand
1.000-499.999	500.000-999.999	2.000.000-2.999.999	1.000.000-1.999.999	7.000.000-7.999.999	9.000.000-9.999.999	8.000.000-8.999.999	2.000.000-2.999.999

To register the SI chip it has to be inserted into the hole in the SI device. After less than one second a beep and a flash occurs (if activated) to confirm the registration. The timestamp is registered on the SI chip and in the SI device. The timestamp is added to the timestamps already available on the SI card (cumulative collection), for the number of storable timestamps, see the table above. In addition, there are fixed memory locations for the Clear(Check), Start and Finish time.

The oldest SI-Card5 stores only half-day timestamps (12 h), the chip variants from SI-Card6 store 4-week-unique timestamps, of which only the weekday information in FjwW is used. For the SI-Card5, it is practically always necessary to clear the SI card before starting the competition in order to avoid problems in the subsequent evaluation. For the other SI cards, a non-deletion causes little problems if all the collected timestamps are on the SI card in the same week and exceeding the max. possible timestamp is not expected.

Since many SI-Card5 are still in use, the organizer must ensure that the SI card clearing is carried out correctly: Insert the SI card and leave it punched until the acoustic **and** visual signal is perceived. This is made very difficult if several clear and possibly check stations are close to each other and so heard the acknowledgment signals of neighboring stations or be seen.

Repeated insertion of a SI card in a fox or finish station after a successful registration within less than 20 seconds results in an immediate acknowledgment (Beep and LED flash), without any further storage in the SI card and the SI Station takes place.

Further information on [www.sportident.com](http://www.sportident.com)

## Preparation of SportIdent stations

For a normal ARDF competition the following SI stations are needed:

- **Clear** It's mandatory to erase all prior timestamps from the SI chip by using the clear station! This is essential when using the SI-Card5, which can store only 30 half-day timestamps. From SI-Card6 they store 4-week timestamp, but in FjwW only the weekday information is used, it could be deleted every week or if an overflow of the timestamps to be saved (different for the various SI cards) threatens.
- **Check** To check whether the erase process was successful, this job is also done by clear station.
- **Start** If the start time is not fixed but taken by a timestamp at the start station; If the data of the start station is to be evaluated immediately by FjwW via the interface, it must have the station number=3.
- **Foxes/Beacon** some stations at transmitters/beacon to take the time and do the timestamp. The station have to have numbers 20...254.
- **Finish** The finish timestamp is written to the chip and registered in the station. It's necessary to place enough finish stations at the finish line to avoid jams. If the data of the destination station is to be evaluated immediately by FjwW via the interface, it must have the station number=4.
- **Read** A master station in conjunction with a PC running the FjwW program is able to read the chips and the timestamps on it.

The stations for clear/check/finish can have station numbers within 1...19.

The SI stations have to be prepared before the competition starts. This can be done with the **SI-Config Plus** (obsoletely **SI-Config** and **SIMAN**) software provided as freeware by the producer of the SI stations AES [www.sportident.com](http://www.sportident.com). Some important settings can be

done with the FjwW software (see ***Interface|Stations Service*** ).

In this mode the station have a programmable operating time (for example 6 hours). After switching on the station it will stay on for the programmed time. If a SI chip is registered the time count restarts from zero and the full operating time available again. To check the proper operation of the SI station a SI card should be inserted (beep and flash must appear). This SI chip should not be used within the same competition because the related timestamp is not only stored on the chip but also in the SI station. The chip can be erased before being used but the station can not be erased when it's already brought to the transmitter! Once programmed the operating time is always the same until it's reprogrammed.

~~The operating time has to be big enough to cover the hiding of the transmitters and the time between the first start and the first found of the transmitter. If a station switches off because the operating time has passed it can not be switched on by the competitors if it's a station prior to BSF7! stations of type BSF7 and higher do not require a switch on. They are always in a sleeping mode and become active after a chip is inserted. No magnet is needed for these stations.~~

**FjwW** can also be used for this purpose. Use ***Interface|SportIdent*** . Select the interface, set the first start time to a value equal or greater than the zero time and select ***Read stations via master***. After the communication with the master station is ok (perhaps help to switch it on with OFF chip) use the function "Interface/Station Service" for setting the relevant options for the stations used in the competition.

After being switched on the stations will be on for the operating time which has been set. Each time a SI chip is registered the operating time starts from zero. The stations can be switched off with the **OFF chip** or with SI-Config or FjwW.

The SI station stores the timestamp in its internal memory. The data is not erased when the station is switched off. The data can be read via a master station at any time. To avoid a memory overflow or mistakes created by older timestamps still available in the stations memory it's recommended to clear the memory of the stations used in the competition. This can be done with **SI-Config** or FjwW (see ***Interface | Backup / Display Data*** ).

## **Mapping of SI station numbers to the ARDF transmitters**

The stations should be programmed with the numbers **31...35...** for the transmitters **F1...F5...**. If more than one station is used at one transmitter the stations must have the same number!

But since the FjwW version 10.6 it's possible to assigned a second/backup station number to a fox. This is particularly in the case of failure (of the SI station at the fox) valuable. In the competition data window this number can be entered in addition, the number of the failed station must remain in FjwW get even, because participants may have already been registered at this tation.

Only in case of exceptions other rules can be applied:

- Exception: The stations are moved to another place where the transmitter number should be different but they can not be reprogrammed. In that case the sequence of station numbers must be changed. The first number is the one corresponding to the first transmitter.
- Exception: More than one competition are organized in parallel having a common finish station (for example if 80m and 2m is done in parallel). In this case the station numbers of one competition could be **31...35** and **36...40** for the second. The relation between station number and transmitter number is set up in the TLN file at the **@SI\_NO\_LIST** entry or in the dialog for the competition data within FjwW.

Mode of operation of the reading station:

There are two ways of using the reading stations:

- Interactive mode

The SI reading station must be connected to the serial interface (or the USB port) of the computer running FjwW. The interface must be enabled within FjwW (see ***Interface|SportIdent***). As soon as a SI chip is inserted into the reading station a message is sent to FjwW. The program fetches the data of the SI chip and sends a confirmation to the reading station. This confirmation causes the reading station to store the data as well. In this operation mode the SI chips can only be read if the station is switched-on and connected to the PC and with FjwW running and an enabled interface.

- Autosend mode

As soon as a chip is inserted into the reading station the data of the chip is stored in the memory of the station and sent out regardless of the status of the PC or notebook. The reading station can be used for automatic reading and storage of SI chips when the competitors arrive.

If the SI reading station is connected to a serial or USB interface and the interface is activated by using

***Interface|SportIdent*** the behaviour is alike the interactive mode. If the reading station is not always connected to a running FjwW (so to say the number of read chips within the station is not the same as those received by FjwW), another way has to be chosen to get the data for the result calculation. A backup of the data has to be done via

***Interface|Backup/Display Data***. The resulting DAT file has to be (re)read by FjwW via ***File|DAT Data File read***.

Attention: If the memory limits are reached **all** eldest timestamps are lost !!!

## Online result calculation, FAQs

Some points for the result calculation and presentation using **SportIdent**

- Preparation of TLN file is done, start lists are printed, PC with FjwW, printer and PC for displaying the results are at the finish area
- Load TLN-/KOR-files for all ongoing competitions
- Connect the SI reading device to the serial or the USB connector of the PC with FjwW
- Activate the interface and check the date and the starting time
- Put a SI chip to check the functioning of the reading device. The chip which was used to check the devices at the transmitters are a good example. The timestamps of the SI chip must be stored in the KOR file
- Connect the PC for displaying the results to the serial or the LAN interface [see](#) 
- Start FjwWdispl / ~~FJWDISPL~~ on the DisplayPC's or start an Internet-Browser
- Release the COMy, LAN and HTTP results on the FjwW computer
- Prepare (network)printer and activate the printing of the finish ticket [see](#) 
- From time to time print a result list with the option 'unofficial' and make it public
- To calculate total results for more than one competition the related TLN-/EDA- files must be loaded. By this total results for the German RLL- or Cup-Rating can be done [see](#) 

**FAQ: What has to be done if...?**

**1. A SI chip was read but the timestamps are marked with red lines in the background. At the upper right corner a bigger number is displayed with some exclamation marks and a sound is played (windows system sound for QUESTION):** The chip or

start number of the chip was not found in any of the loaded competitions. The timestamps cannot be put into relation to any competitor. The timestamps are written into the KOR file(s) of the competition(s). If the error is corrected and the chip number is related to a competitor the KOR files can be reloaded and the timestamps are correctly put into relation with the competitor.

## **2. When moving the transmitters from one competition to another one the transmitter numbers change:**

Within the **@SI\_NO\_LIST** in the TLN file the relation between transmitter number and device code can be freely chosen. The relation is e.g. **F1** -> 31 ... **F5** -> 35 but other relations are possible as well (example: the entry of 34 31 33 35 32 will be interpreted as F1->34, F2->31, F3->33, F4->35, F5->32. This relationship can also be changed in the window with the competition (head) data. If the reading of the timestamps reveals an unknown number they are not mapped to a transmitter number. Instead of this the number is incremented by 1000 and written to the KOR file anyway.

## **3. At the German championships with participation of competitors from foreign countries only the German competitors should be taken into account to calculate special lists (for example the DARC ranking):**

The groups used within FjwW can be used for this purpose. For this German competitors have a different indicator than the international guests. As an example the German competitors get no entry and the others get the entry **INT** (this can be achieved by writing it into the TLN file or by using **Edit|Correction FH/Hlp Data** . When creating the result lists the

**Edit|Options of Lists/Group select** has to be modified. The characters "[ ]" represents all users without a group. It has to be moved from the **Existing groups** with <++ to the **Rating groups** field. As a result only German competitors will be displayed and used for calculation.

## **4. A SI master device is available to register only the finish time of the competitors:**

The SI device has to be programmed as 'finish' and it has to be placed at the finish line. After the competitors have done their finish time stamp a backup of the data has to be done via

**Interface|Backup/Display Data** . The saved DAT file has to be loaded via **File|DAT Data File read** . By this operation the finish time for the competitors is automatically updated. The real number of found transmitters has to be manually entered via **Edit|Correction FH/Hlp Data** .

#### **5. The start time of the competitors should be taken from a SI device:**

In the TLN file the parameter **@STT\_IN\_DAT** has to be set to 127. Alternatively within the competition data window the parameter **Start time from** has to be set to **SI Startstation**. The start times from the TLN and/or KOR file are automatically erased. When the competitor arrives at the finish and the chip is read the start time is set to the time of the timestamp of the SI device which was declared to be the start time. The same happens if the timestamps are read from the given SI device or a DAT file via

**File|DAT Data File read**

The stored start time after registration in the SI start station can be used not rounded or round up to **full 1, 2, 2.5 or 5 minutes (60, 120, 150 or 300 seconds)**. With rounding up, several participants get the opportunity to register one or two or five minutes before in a start-station and to start in the right second from the starting line. The result is a very simple launch process (e.g. FoxOring: the exact start time have no importance because all the transmitter are working permanently.)

If the start times of competitors read out from the start station as DAT file and read in again in FjwW until competitors arrive the finish, no constantly renewed display of current run times of competitors will be happens in the main window.

It is also possible to connect a with AUTOSEND programmed start station on the COM-B interface and to activate in menu

**Interface|SportIdent/COM B Port/COM C Port** and

select **Fox/Start data reading**. Then the starting time immediately read in with the punching of SI chip and are available for analysis.

## 6. The registered times from one of the SI devices at a transmitter should be taken as the start time:

For example a 80m and a 2m competition with 10 transmitters is done. The 80m part consists of the transmitters 1 to 5 and the 2m part of the transmitters 6 to 10. The two parts should be counted separately. The starting time should be taken from a transmitter 11 which is the finish of 80m and the start of 2m.

<u>In the TLN file</u>	or in the	<u>#Window for the competition data</u>
@STT_IN_DAT: 11		#Start time from Fox 11 (SI-No 41)
@FT_IN_DAT: 0		#Finish time from Finish station
@FINISH_NO: 12		#Fi.No
@FOX_LIST: "M21" 6 7 8 9 10		#Fox list
@SI_NO_LIST: 0 0 0 0 0 36 37 38 39 40 41		#SI-No

the above data has to be entered.

The finish number must always be the highest number. The number of the transmitter being the finish and the start between the competitions can be whatever number is chosen. But the chosen number is not taken as a found transmitter anymore (for example transmitter 5 of competition 80m).

## 7. A competition with 10 transmitters and a finish in the middle should be calculated as two separate competitions and as a single competition:

For the first part (for example 80m) the transmitters 1 to 5 are taken (SI devices with numbers 31 to 35). The finish in the middle is transmitter 6 (SI device number 36). For the second part (for example 2m) the transmitters 7 to 11 are taken (SI devices with numbers 37 to 47). Transmitter 6 should be taken as the start time and a normal finish as the finish time.

### Single competition

<u>In the TLN file</u>	or in the	<u>#Window for the competition data</u>
@STT_IN_DAT: 0		#Start time from TLN file
@FT_IN_DAT: 0		#Finish time from Finish station
@FINISH_NO: 12		#Fi.No

```
@FOX_LIST:      "M21"  1 2 3 4 5 . 7 8 9 10 11  #Fox list
@SI_NO_LIST:    31 32 33 34 35 36 37 38 39 40 41 #SI-No
```

## 80-m-part

```
In the TLN file           or in the           #Window for the competition data
@STT_IN_DAT:  0                #Start time from TLN file
@FT_IN_DAT:    6                #Finish time from Fox 6 (SI-No 36)
@FINISH_NO:    7                #Fi.No
@FOX_LIST:     "M21"  1 2 3 4 5  #Fox list
@SI_NO_LIST:   31 32 33 34 35 36 37 38 39 40 41 #SI-No
```

## 2-m-part

```
In the TLN file           or in the           #Window for the competition data
@STT_IN_DAT:  6                #Start time from Fox 6 (SI-No 36)
@FT_IN_DAT:    0                #Finish time from Finish station
@FINISH_NO:    12              #Fi.No
@FOX_LIST:     "M21"  7 8 9 10 11 #Fox list
@SI_NO_LIST:   31 32 33 34 35 36 37 38 39 40 41 #SI-No
```

**8. The start times of some competitors should be set to a dedicated starting group or a dedicated starting time (this can be the case if some competitors want to start together), all others should be randomly distributed:**

a) In the TLN file for those competitors a start time can be written in the **START** column or the number of the starting group can be written in the **SET** column (preceded by an asterisk "\*" or a minus sign "-"). The TLN file has to be reloaded after the modifications. The best is to unload the competition, modify the TLN file and reload it.

b) Using **Edit|Correction FH/Hlp Data** the start times of the competitors are set manually.

The raffle of start times must be initiated via

**File|Balloting Start Times** . To assure that only those competitors are given new start times the options **Existing start times deleting** and **all** must not be selected. If they are selected previously entered start times are erased and recalculated.

**9. Competitors not existing in the file Namensliste.txt were added to the competition. These names should be taken over into the Namenslist and updated data of other competitors should be saved as well**

After using **Edit|FH/Hlp Registration** the file Nameslist.txt is

loaded. With the option **<Special>** the dialog window is enlarged. By activating the option **Append** the actually loaded file of competitors is appended to the list and the number of entries is increased. Click **Merge** to delete identical entries and to merge additional information if it exists. The competitors who did not exist before in the file Namensliste.txt stay untouched. Using **Search** it has to be checked if there are no double entries or entries with conflicting data like same name but different club or unequal names but the same call sign. These entries can be edited, modified or deleted manually. After these operations the new set of data should be saved. If a new filename is used the old file remains as a backup.

### **10. After the year has ended a lot of categories in the file Nameslist.txt will not be correct any longer. FjwW helps to identify these conflicts:**

After loading the file Namensliste.txt all the categories which are not correct compared to the age of the competitor are preceded by a question mark “?”. With **Search** they can be displayed one after the other. At every turn of the year there are many changes to the category (with currently >9000 entries in name lists 1&2).

Modifications can be done.

How to proceed? Select the list of names and save it immediately. After opening the file with the FjwW editor (or any other editor which does NOT replace tabs with spaces) the wrong categories can be replaced by the correct ones. wrong categories are preceded by a question mark (?). With the search&replace option the replacing is very easy. Just replace as follows:

```
?W19 -> W21      ?W21 -> W35      ?W35 -> W50      ?W50 -> W60
?M19 -> M21      ?M21 -> M40      ?M40 -> M50      ?M50 -> M60      ?M60 -> M70
?JUN -> SEN      ?SEN -> OT       ?OT -> VET
```

### **11. How can a preview of the printout of a result list be displayed within the editor?**

As a preparation the margins have to be set correctly using **File|Print Setup** . At the preview the option **View|Print Preview** has to be activated to see the pages, as

they will be printed. Every modification within the editor will be displayed after a short delay (for example the change of the font).

## 12. How can I find out which timestamps are correct if a competitor did not erase his SI chip before he started?

Not erasing timestamps of a prior competition can lead to the fact that more transmitters are counted for the competitor as he really found. This behavior is a result of the fact, that the SI chip timestamp is only unique within a 12 hours timeframe. If there are timestamps left which are within the start time and the end time of the competition they are counted as founds.

To correct this error the KOR file has to be loaded into the editor of FjwW. There a search is available **Edit|Find**. For example the SI chip number can be searched (in the example number 5588) or the starting number (in the example number 43). The following lines will be found:

```
#StNo=43 - #at14.50:10 Chip=5588
 1 43 11.56:05'00 24-4-04 0; @id5588
 7 43 12.08:42'00 24-4-04 0; @id5588
 9 43 12.15:23'00 24-4-04 0; @id5588
 1 43 12.06:27'00 24-4-04 0; @id5588
 2 43 12.28:20'00 24-4-04 0; @id5588
 5 43 12.45:14'00 24-4-04 0; @id5588
 3 43 13.05:28'00 24-4-04 0; @id5588
 8 43 13.46:53'00 24-4-04 0; @id5588
 7 43 14.14:32'00 24-4-04 0; @id5588
 6 43 14.26:21'00 24-4-04 0; @id5588
128 43 14.38:49'00 24-4-04 0; @id5588
```

The rows represent the timestamps as they are stored on the SI chip. The order is the order within the chip. The leftmost column is the transmitter number. The finish has always number 128. In the same order the timestamps are read, when the competition data is loaded. If a number appears two times, the data is overwritten with the last timestamp read. In the above example number 1 and 7 are overwritten by the following number 1 and 7. But also the timestamp for transmitter 9 is stored in the competition because it is within the starting and the finish time. If number 9 is also a valid transmitter number for the category in which the competitor started this transmitter will be treated as a found transmitter. The competitor gets more transmitters than he has really found.

In the above example it can be clearly said that transmitter 9 was part of a prior competition which was not erased because **the timestamps within one competition are stored in ascending order.**

Via **Edit|Correction FH/Hlp Data** the time for transmitter 9 for the competitor with SI chip number 5588 is set to 0. By this the problem created by not erasing the SI chip is solved.

### **13. How can I easily load more than one competition to evaluate the actual RLL results (= German ranking) while a competition is ongoing?**

The best way to do so is the usage of a command file or command line (prompt). The current competition has to be loaded first. The usage of wildcards like ? and \* is allowed.

ATTENTION: If the file or directory names include spaces the name has to be enclosed by "...".

Examples for a CMD or BAT file or command line:

We assume that the competition data is stored in the following three directories:

C:\Data\040814C:\Data\040815C:\Data\RLL 2004

Example 1:

```
FjwW.exe c:\Data\040815\040815.tln c:\Data\040814\040814.tln
```

Example 2:

```
C:
```

```
cd \Data
```

```
FjwW.exe 040815\040815.tln "RLL 2004\040814.eda"
```

Example 3:

```
C:
```

```
cd \Data\040815
```

```
FjwW.exe 040815.tln ..\040814\040814.tln "..\RLL 2004\04*.eda"
```

For example 4 there are many competition data in same path, only

data of 2005 should be load  
C:\Data\RLL 03-05

Example 4:  
FjwW.exe "C:\Data\RLL 03-05\05\*.tln"

**14. In a Swedish competition the last found fox determines the finish time.**

For that choose in window 'Competition data' (Ctrl+F3) in combo box ***Finish time from*** the entry 'Last Fox' or set the key word **@FT\_IN\_DAT:** in the TLN file to "256".

**15. During a competition a SI station falls in 'out of order'.**

Since the FjwW version 10.6 it is no longer necessary for all (one or more) SI stations on transmitters must have the same station number. Now a second station may also be used at a transmitter, of course, one which is not used at other transmitters already. For the unexpected accident a prepared SI station, e.g. programmed with a station number  $\leq 254$  (from a reserve pool) can be brought immediately to the transmitter. The SI station number has to be entered in the 'Competition data' window.

**16. In an ARDF World Championship, an 80m and 2m competition will be held for two groups of categories at the same time.**

This allows a better separation of categories in the field can be achieved. So there is a start, twice 5 foxes, common finish beacon and finish. In FjwW, these two separate competitions can be combined in one TLN file. An example of this can be found in the "Examples" directory under the FjwW directory with the file name "**\_WC2016m80+2.tln**".

**17. In a SPRINT competition up to twice 5 stations are to be searched and in between a spectator point to found. How should this be set in FjwW?**

For this purpose, a fox station is set up at the spectator point and in the Fox lists of the categories the station number with an exclamation mark '!' expanded. Example:

In the TLN file it looks like this:

```
@FOX_LIST: "M19" 1 3 4 5 6! 11 13 14 15 #Foxlist M19
@FOX_LIST: "M21" 1 2 3 4 5 6! 11 12 13 14 15 #Foxlist M21
```

That means for category M19: first of all the transmitters F1,3,4,5 in any order, then the spectator point F6 and then the transmitters F11,13,14,15 (any order) to visit. The transmitter F6, also called 'mandatory fox' in FjwW, is included correctly in the calculation of the optimal search sequences of the categories. If the participant does not observe the correct order, this will be indicated in the result table by a red background in column 'Order'.

A detailed example of a TLN file for a Sprint competition can be found in the "Examples" directory under the FjwW directory with the filename "[\\_bsp-sprint.tln](#)".

**18. In a SPRINT competition, the spectator point and the finish beacon are in the same location,** there is only one beacon transmitter and the SI beacon station (possible concerning IARU rules, point S3.4). Then the station number is also to be set for the spectator point. The locations of spectator point and finish beacon have to be the same. Example:

In the TLN file it looks like this:

```
@FIN_BEACON: 6
@FINISH_NO: 7
@SI_NO_LIST: 31 32 99 34 35 99
@FOX_LIST: "M21" 1 2 3! 4 5
@OPTIONS: SptO
@POSITIONS: 0:0/100:100/200:200/666:666/400:400/500:500/666:666/800:800
```

**19. In an FoxO competition there should be no start and finish location.** The participant begins by searching for any fox (results in the start time), the finish time results from the stamp time of the last fox visited. Example:

In the TLN file it looks like this:

```
@FINISH_NO: 11
@STT_IN_DAT: 255
@FT_IN_DAT: 256
@SI_NO_LIST: 31 32 33 34 35 36 37 38 39 40
@FOX_LIST: "M21" 1 2 3 4 5 6 7 8 9 10
@POSITIONS: /100:100/200:200/333:333/400:400/500:500/
@OPTIONS: FoxO
```

The stamp time of the first fox becomes the start time, the fox time itself is increased by one second. The stamp time of the last fox found becomes the target time, the fox time itself is reduced by one second.

## Two or more competitions a day

If two or more competitions are to be held in one day, proceed carefully so that no problems arise. The examples describe it for two competitions, in several cases this applies analogously.

First of all, it is important to know how FjwW works: If multiple competitions are available by loading their TLN files with the date of the contest day, the SI chip data read from a SI read station is written into the KOR files of these competitions. This allows, among other things, later changes in the conditions of competition, without having to re-read the SI chips.

There are two cases where different procedures are required:

- There is no overlapping of the end time of the first and the start time of the second competition !

**Example:** 1th competition 9:00 to 12:59 --- 2nd competition 13:00 to 17:00

Both competitions can be loaded in FjwW, because of the non-overlapping competition times, the read SI chip data can be clearly assigned to the right competition. It goes without saying that only one competition can be loaded alone at the right time and the evaluation can be made.

However, may not be made the error here, to change the end time of the first competition to a later time (for example, because a competitor has reached the finish after the planned end time and still has to be evaluated). Then fox/finish times of the first competition can also be effective in the second competition or start/fox times of the second competition in the first competition, this change the result certainly.

- The end time of the first competition is after the start of the second competition /

**Example:** 1th competition 9:00 to 13:30 --- 2nd competition 12:30 to 17:00

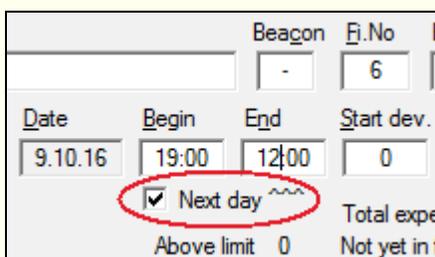

In order to prevent the above-mentioned problems, a different procedure must be followed.

First select the menu **Extras|Several FjwW instances** and after that load only the first competition in FjwW. Then the second competition is to be loaded by double-clicking the second TLN file or by starting FjwW itself and loading the second TLN file in this second instance of the FjwW program. Now both competitions are completely separated from each other in the two instances, the overlap problem is no longer present. However, two SI read stations must also be used, each instance requires its own reading station on another COM port. The HTTP server can only be activated in one instance (but this can also be bypassed with a second INI file of the second instance and another port of the HTTP server).

### One competition on two days (goes over midnight)

If the competition end time is to be on the following day, the checkbox

**Next day** ^^^ must be activated in the competition data window (CTRL+F3), see picture on left.

The screenshot shows a window titled 'Beacon' with a 'Fi.No' field containing '6'. Below this is a table with columns 'Date', 'Begin', 'End', and 'Start dev.'. The 'Date' field contains '9.10.16', 'Begin' contains '19:00', 'End' contains '12:00', and 'Start dev.' contains '0'. Below the table, there is a checkbox labeled 'Next day' which is checked and circled in red. To the right of the checkbox, there is a 'Total exp' field with the value '0' and a 'Not yet in' field.

~~Under **Interface|SportIdent** should be entered the date and begin time of competition in the field **Date !!! First time.** All timestamps of the second day are marked in different windows and lists with an appended **a** (like **a** nother day).~~

#### Important:

The use of SI-Chip5 (Nr <500000) is possible if all timestamps on the chip are within 12 hours after the begin time of the competition. SportIdent chips of **Type 6 (also 8,9,10,11,SIAC)** can be used without restriction within the 48 hours of both competition days.

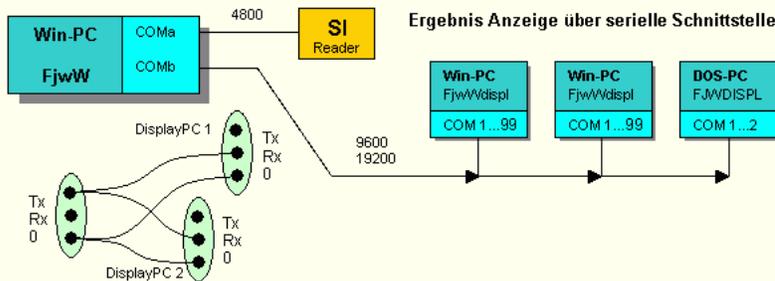

For experienced users: If the SI-Chip5 should/must be used, this is possible if a manual correction is made after reading the chip for all start/fox/finish times. All timestamps that are on the second day of the competition must be extended by the lowercase letter "a" (e.g. **10:12:34a**) and all timestamps must be checked in the morning/afternoon and thus the time may be increased by 12 hours !

## Display of results

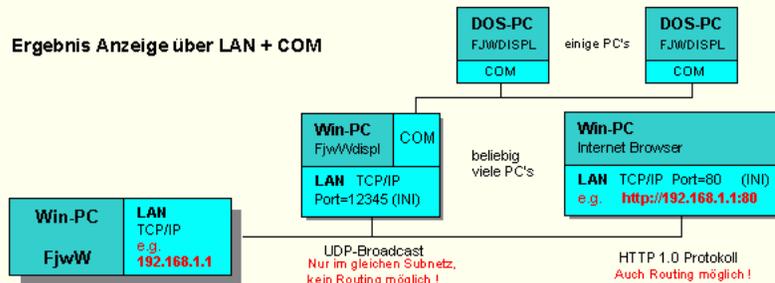

FjwW is able to display results in text form with 16 foreground and background colors on computers connected via a COM or LAN/WLAN interface and running the FjwWdispl program. When using the COM interface, the appropriate cables, as shown above, must be available. When using a LAN/WLAN network, any number of computers can be set up for viewing. A configuration of the IP addresses of these DisplayPCs is not necessary, the display data is sent as a UDP broadcast (radio) transmission, which only works in the immediate network, i.e. it ends with a router.

There are different ways to display the actual results:

- On PCs connected via the serial interface.  
Using Windows 2000 or newer the program **FjwWdispl** is used to display the results.  
~~Using DOS 5.0 or newer the program **FJWDISPL** is used to display the results.~~

- On PCs connected via a LAN using the TCP/IP protocol (Windows 2000 or higher).  
The program **FjwWdispl** or an **Internet-Browser** is requested.

The programs **FjwWdispl** and **FJWDISPL** are delivered together with FjwW.

In the menu **Interface|Result Display** the available options to display the results on other PCs can be chosen. FjwW send with the set cycle time there (10...99 sec) the results of all categories. All contained category results in the list of items to display categories (option /I?) are stored and the DisplayPCs with the cycle time selected here (5...60sec) displayed successively. If several DisplayPCs installed, it can be achieved by different launch of FjwWdispl and little different set cycle times that not all displays show the same category results.

To assure, that data can be transferred via a radio transmission the RTS line of the serial interface becomes high about **200 ms** before the first data is transmitted (**+ level**) and **10 ms** after the last byte was transferred (**- level**). With this signals the transmitter/modulator can be driven correctly, so it is ready when the first data arrives.

The program **FjwWdispl**

Starting the program without or with incomplete parameters shows a dialog window in which the setup can be defined easily.

If the program is started without options, a dialog appears first in which all settings can be made, they are saved in the registry. If started with some options on a command line the dialog does not pop up and the program starts to run (no storage of the options in the registry):

Start: **FjwWdispl.exe [/p?] [/s?] [/u?] [/c?] [/q?] [/l? ,?,... ] [/d?] [/f" .." ] [/t" .." ] [/m?] [/k?] [/w?] [/z?] | [/?]**

```
/p - COM-Port (1...99), default=1
/s - Fixed transfer rate (1,2,4,8,16,32,48,96)*1200 Baud
    default=38400 + automatic adaptation of the baud-rate.
/u - UDP Port, default=12345
/c - Max. number of character per line (45...125), default=80
/q - Sound on receiving/key using (/q0, default), no (/q1)
/l - List of categories/lists to be displayed (0,1,...34)
    The number is derived from the sequence number in the TLN-file
    or from the order of the categories in the toolbar of FjwW
/d - Printout enabled (/d"Printer Name"), (default no printer)
/f - Font, e.g. /f"Lucida Console"
/t - Text in foot line, e.g. /t"ARDF WC 2008 Korea"
    First four characters "0x??" control the text/background color, see below
/m - Display on monitor (1,2,...), default=1
/k - Key lock for choosing categories (F1...)
/w - Delay at launch, wait for network, default=0 sec
/z - Cycle time for displaying the results of categories (5...60 sec)
/? - This help text
```

A with "0x??" beginning text controls the text/background color of the title line. Both question marks can be the characters "0...9,A...F", the first for the background, the second for the text color. In this order it means the colors:

black, dark blue, dark green, dark cyan, dark red, dark magenta, dark brown, dark white, gray, cyan, green, blue, red, magenta, yellow, white

Only the first 22 categories sent to the DisplayPC can be chosen manually (keys **F1 . . . F12 , 1 . . . 9 , 0**). If automatically displayed, all categories will be shown one after the other. If filtered by the **/l** option, only these categories are displayed. On each DisplayPC the categories to be displayed can differ.

If FjwWdispl has already been started, a further start on the same monitor (1 or 2) causes the screen to be split vertically for both of them. So that this happens in the desired order on the display when starting twice in a .CMD file or two links in the autostart, a longer delay with the **"/w?"** Option is required for the second instance, which should be visible in the lower part to specify. Special characters for the title line can only be transferred with a link (.lnk file).

### Example:

```
In the competition the following categories exist in the given order:
W19 W21 W35 W50 M19 M21 M40 M50 M60 W10 W16 M13 M16
-----
If FjwWdispl is started with the following option:
/L10,11,1,2,3,4
all the categories having a 'W' in its name are displayed and can be
selected by the function keys:
F1 F2 F3 F4 F5 F6
W10 W16 W19 W21 W35 W50
-----
If FjwWdispl is started with the following option:
/L5,6,7,8,9,0
all the categories having >= 'M19' in its name and the arriving list
are displayed and can be selected by the function keys:
ESC F1 F2 F3 F4 F5
E M19 M21 M40 M50 M60
```

This variant of the display is created by starting the following links or command lines at about the same time.

```
"..\FjwWdispl.exe" /c56 /w2 /u12345
"..\FjwWdispl.exe" /c65 /w5 /u12356 /t"_____ Finish result"
```

```

The number of columns after '/' determines the font size (may vary), the start delay at '/' determines the position (top/bottom) on the screen.

**FjwWdispl** does not access the hard disk after being started. New possibilities have been added because of the availability of the graphical interface. When starting the program an individual footer can replace the standard footer (add some spaces if needed).

```

Example of displaying the team results of the countries/clubs in all categories by keys **ESC**, **E** in **FjwWdispl**.

If a category is chosen via **F1...F12, 1...9, 0** or **ESC, E**, **E** is used to display the arrival list the screen does not change for about 20 seconds.

Example of display by keys **ESC, E**, display the first three ranked in each category and the last six participants who have reached the finish.

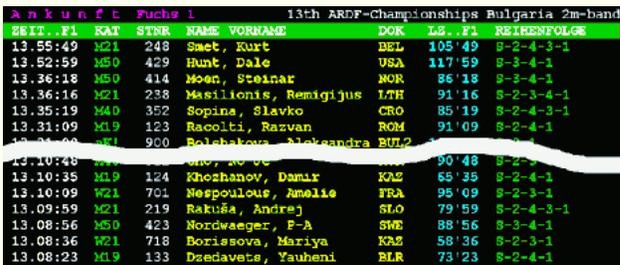

In this example the participant 'Baxa, Jaromir' has just read out his Slchip, marked in the lower part with **\***. Therefore, its category M60 in the upper part with a **!** marked because it reached a place 1...3. Both markings have a **red** border.

Before that, the participant 'Hilbert, Antje'

achieved the same thing (**green** bordered).

After a while, **\*** and **!** again, while an acoustic signal sounds.

For a speaker at the finish, only the option **E** for **Displayed categories** should be selected when starting FjwWdispl!

Example of displaying fox arriving

FjwWdispl as well as FjwW are using the **UTF-8** character set. Because of this all characters are displayed correctly (eastern European characters, cyrillic characters, Arabic characters, and so on). UTF-8 is supported by Windows NT and more recent versions of Windows.

The following keys can be used:

- F1...F12, 1...9, 0** Display a defined category manually 1...12, 13...22
- NUM Bloc 0...9 / \* .** Display a defined category manually 1...12 ~~not in~~ **FJWDISPL!**
- Esc, E, e** Recently arrived competitor (entries)
- Cursor/page up, NUM+** Display next competitors
- Cursor/page down, NUM-** Display previous competitors
- Home** Display starting with the first place
- End** Display down to the last competitors
- P, p, D, d** (P)rint/(D)ruck of the category actually on the screen
- Q (Shift!)** (Q)uit Stop the program

The picture shows the keys used on an external numeric keyboard (USB connection)

## HTTP-Display

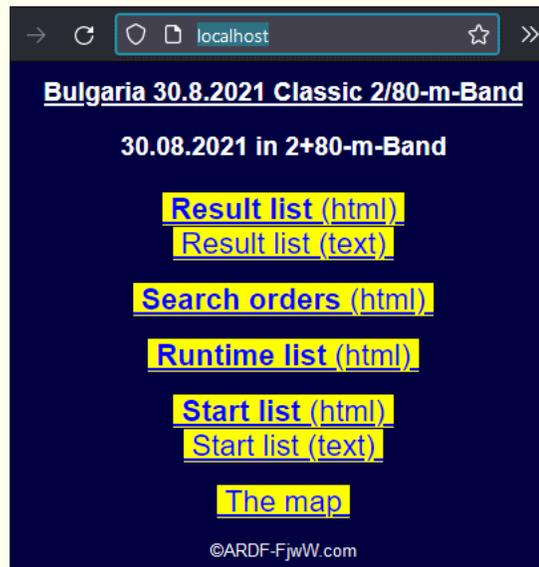

Using the menu **Interface|Result Display** and selecting the option **HTTP Display** will start the integrated HTTP/Web server. This Web server will create a set of result lists to be displayed via LAN (TCP/IP port 80, default).

If the DisplayPC and the FjwW server is connected to the same LAN just enter the URL **http://w.x.y.z** in your preferred WEB browser (**w.x.y.z** is the IP address of the FjwW HTTP server). A homepage with some links is displayed. A click on the required result list will show it. The list can be saved if needed. Is running a HTTP server on PC already on default port 80, it's possible with INI entry e.g.

**HTTPport=8888** to assign the Web server of FjwW this port 8888, so both server are able to work.

Starting with version 11.3 parallel to the web server also a simple DNS server (Domain Name System, port 53), which allows the resolution of a name into the IP address of the Web server. This name is read at launch of the Web server from the INI file (section **[Interface]**, keyword **HTTPfjwwURL=**, default "www.ardf.aaa"). If this name is entered in the URL of the client's Internet browser, the web server can be reached. The name is good to choose, it should not be resolvable on the Internet and should be processed by the various operating systems (Windows, Android, ...) and browsers (Firefox, Edge, Chrome, ...) so that the DNS server is also achieved in FjwW. "www.ardf.aaa" is a working example.

For example to make sense in the finish area, use a WLAN router with activated DHCP server. The evaluation PC is assigned a fixed IP address and this address is set as a local DNS server in the router (not all routers allow this!). Then you can hang a notice in the finish area, as the picture shows. An easily recognizable name (SSID) of the WLAN router should also be selected.

The lists are representing the result at the moment the page was opened (no automatic update!). The page can be updated using the browser options (e.g. F5 updates the screen on an Internet Explorer).

When working at smaller competitions with common start and finish location, it is 'very bad', if there computer results, routes, maps, locations show that could see not yet started competitors. Therefore, there is the possibility to display these to suppress temporarily. For this purpose in menu

**Interface|Result display** the checkbox **Show not any result/files, but start list only** is to activate. The map must have the file name **~XXX-map.jpg**, in which **XXX** is the file name of loaded TLN file (without extension). The presentation of the terrain map is then suppressed in the above

described activation.

This also applies to other files/images in a self-created homepage (see next section) are integrated: a **tilde "~"** as the first character of the file name causes the suppression of the display when activated above described checkbox.

The user can create his own homepage and show it to the public. The HTML design of the homepage is free. The homepage has to be set in the INI file of the application (**firstHTTPpage=**). All necessary files for homepage have to exist in directory, which is defined in INI file under key word **HTTPpath=**. This directory must be writable! The LOG directory in the FjwW program directory is specified in the delivered INI file, which may have to be changed immediately.

Within the homepage certain keywords (see below) are replaced at runtime by the actual values. The list for multiple competitions can be addressed by this way as well as special lists (Rangliste, Pokalwertung, ...).

If the templates are installed the following homepages are provided with the software:

\_http-layout-DM.htm

The create a link to a certain result list the following syntax has to be used:

**<a href="@[1]-erg.htm">Listname</a>**

**red** always @

**blue** Number of the competition to be displayed ([1]...[32] or [])

**green** Fixed extension for the available result lists

Single competition, number 1...32 in [ ]

**-erg.txt** Result list (Text)

**-erg.htm** Result list (HTML)

**-erg.rtf** Result list (RTF)

- rll.htm Ranking list (DARC) (HTML)
- pok.txt Cup result (Text)
- pok.htm Cup result (HTML)

To get the heading line of a competition onto the homepage a fixed text can be used or a keyword which will be replaced by the actual value when displayed in the browser:

### @[1]CONTEST\_TITL:

- red** always @
- blue** Number of the competition to be displayed ([1]...[32] or [])
- green** Keywords which can be used (these are the same keywords as those used in the TLN file!)
- CONTEST\_TITL:** Short description of the competition
- CONTEST\_TYP:** Type of competition
- PROMOTER:** Organizer
- CALL\_PROMOTER:** Call of the organizer
- CLUB\_PROMOTER:** Club of the organizer
- DATE:** Date
- BAND:** Band (80m/2m)
- LIMIT:** Time limit
- START\_DELAY:** Start deviation
- FIRST\_START:** First start, begin of competition

As a template the following files can be used:

- \_http-page-DM-tag1.htm** German Championships, first day
- \_http-page-DM-tag2.htm** German Championships, second day
- \_http-page-RLL.htm** Competition of a Rangliste

The files have to be stored in the temporary directory or in the directory specified in the **HTTPpath=** of the INI file.

Additional files can be saved in this directory. They can be displayed in the browser (e.g. The file **test.txt** by typing **http://w.x.y.z/test.txt**). The following file types are supported:

- \*.txt \*.kor \*.dat \*.tln \*.eda **Text file**
- \*.htm \*.html **HTML file**
- \*.gif \*.jpg **Image file**
- all others **Text file**

Please note when a firewall is enabled, the above ports (12345...12372) can be locked. If necessary, disable the firewall or allow the use of these ports.

## Example for finish tickets on Brother Label Printer

With a Label printer **QL-500/550/560/570/700** of Brother

Name, Vorname		DOK	Call
Siatek, Daniel		S27	
Kat	Chip-Nr	StartNr	Ges. Laufzeit
M21	410483	2	63'31 min
Laufstrecke		>6490 m (Optimum 6460 m)	
Reihenfolge	Zeit	Diff	Kumulativ
Start	11:30:00		0'00
Fuchs 1	11:24:30	14'30	14'30
Fuchs 3	11:31:27	6'57	21'27
Fuchs 2	11:42:37	10'40	32'07
Fuchs 5	11:55:23	13'16	45'23
Fuchs 4	12:05:33	10'10	55'33
Fuchs 6	12:12:46	7'13	62'46
Ziel	12:13:31	0'45	63'31
Intern. Dt. ARDF-Meisterschaft 2006 2=			
www.ARDFF-FjwW.com			

may be printed good-looking finish ticket, which may contain graphic elements.

With the Currently 2019 available, small label printer from **SportIdent** (Li-battery, Bluetooth/USB, 58mm paper) simple finish tickets can be created

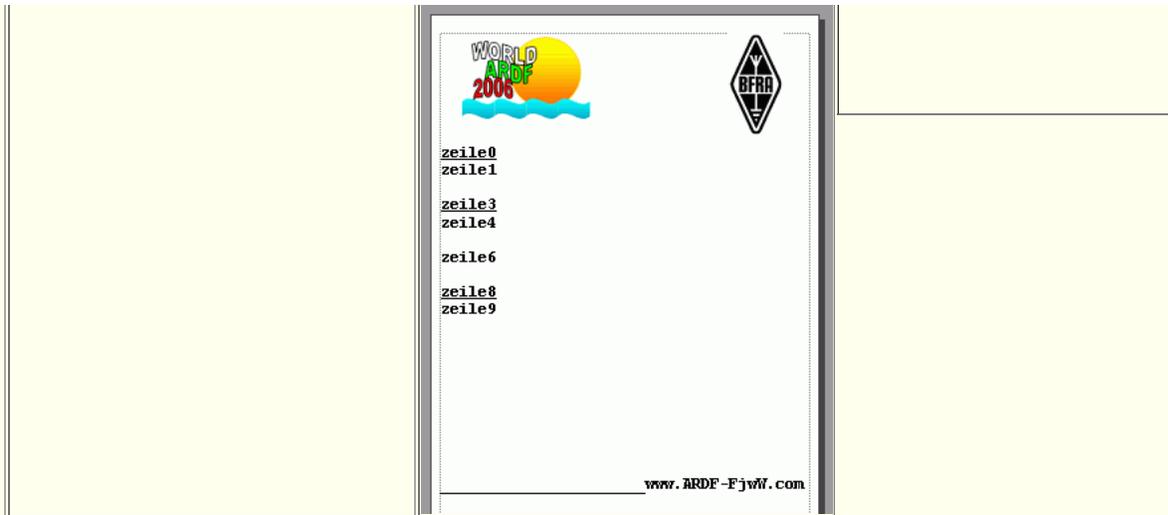

For that it is necessary to create label layout with the Brother-Label-Editor (see \*.lbl in directory 'Examples' under FjwW-uni) and also to install a special FjwW-BrssCom-Interface. **FjwW-BrssCom** can be obtained from the [Autor](#). It's better to download and install the newest driver from BROTHER internet [Driver 'bcciw30016.msi'](#) (end of 2012). This version will bring no problems with special character, e.g. 'S with Caron' .

The following entries in the **INI file** under the section **[Ticket]** have to made:

- Behind the key word **BrotherTicketPrinterName=** must be entered the name of label printer, exactly the same spelling as in "Windows Start/Settings/Printers and Faxes",  
Example: **BrotherTicketPrinterName=Brother QL-560.**
- Behind the key words **BrotherLabelFilePortrait=** and/or **BrotherLabelFileLandscape=** must be entered the Label file for Portrait- and/or Landscape format. The file name can be a relative pathname of directory FjwW-uni  
Example: **BrotherLabelFilePortrait=Examples\Ticket\\_TicketLabelHochDM.lbl**  
or a absolute pathname  
Example: **BrotherLabelFilePortrait=c:\temp\\_TicketLabelHochDM.lbl.**
- If two tickets are to be printed immediately at the finish, set **tiDouble=1**

From FjwW generated text	Label Layout (Display in 'P-touch Editor')	Printed ticket

Ziel	15:25:18	8'28	60'18																																																					
1.Lauf zur Fränkischen Peilmeisterschaft																																																								

Please note when you create the label layout with the P-touch Editor:

- Each line should end with line and finished in a font/size to be formatted, only the first character decides the layout of printed ticket. The font size must be such that can be printed for the portrait format 40 characters in one line. The font should have the same character width for all characters (for example, "Courier New ")
- The text lines are to be within a framework, the lines are numbered from top to bottom, zero(0) beginning. This has significance for the subsequent replacement of the text lines of the layout by FjwW before printing.
- Clipart files cannot be used for the target ticket printing.
- The information about the type of printer driver are stored with the template, therefore, the computer attempts to contact the printing of the template is always used when creating the template set driver.

## Registration of returning rent chips

FjwW supports the different response to participants with their own or borrowed SI chip. In competitions with many participants, it is quite a time problem to collect the rent chips again and register them in a simple way.

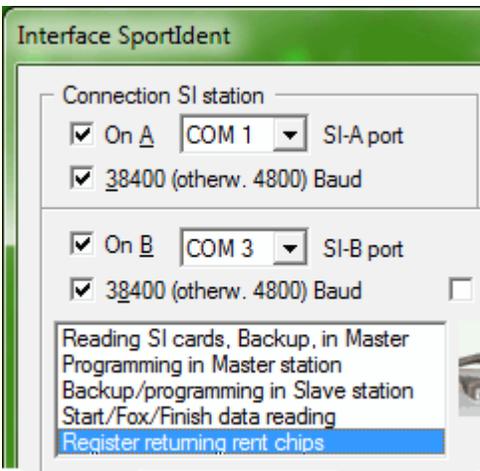

For this it is necessary to use an SI reading station that is **!not!** programmed in "Compatible protocol" mode or **!not!** in "Extended protocol" mode (different designations in the SportIdent **SI Config+** and SI-Config programs.

The SI reading station is connected to port SI-B and the setting **Register returning rent chips** is to select. The returned SI chip is inserted and all loaded competitions are searched for a participant with this chip number. After issuing the Rent chip list (sorted by chip numbers) you get an overview of the (not)returned rent chips, but also returned chips that are not marked as rent chips.

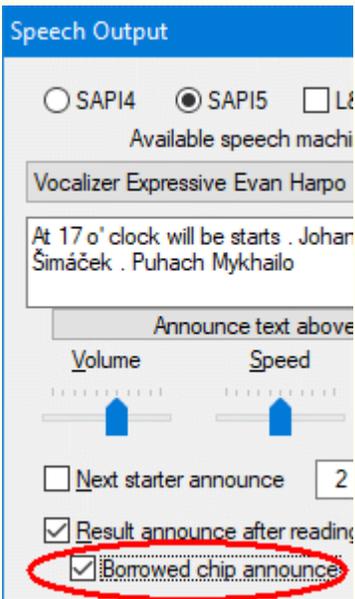

In the case of large events with several competitions for which rental chips are issued, the return of rental chips can be registered at the end of last competition. The 'normal' reading station is connected to the SI-A port, and the reading station for registering the rental chips is connected to the SI-B port, see below. If the Speech output is set so that an additional announcement is made when the borrowed SI chip is read at the first reading station, the rental chip can be punched immediately in the second reading station and the rental chip can be returned.

If the previous days competitions are also loaded, the return registration will be effective in all these competitions.

An example for settings under menu **Interface|SportIdent**

Settings under menu **Interface | Speech output**

# DCF/GPS clock synchronization

With the program **DCFGPSvdb** and a receiver for the DCF signal the internal clock of the PC can be set automatically. The DCF receiver receives a high precision time signal from Frankfurt/Main. The precision of this time signal is better than 0,1 sec! The DCF receiver has to be connected to a (real) serial interface of the PC. A USB-serial-converter will **not** work! Also a GPS receiver can be used (e.g. so called 'GPS mouse'), mostly with USB interface. He receives the exactly time signal from satellites and has to deliver the data in protocol of NMEA-0183.

Start with GPS receiver: **DCFGPSvdb.exe port baud** [Start for demonstration](#)

**port** COM port (1...99)

**baud** Baud rate (>=300, e.g. 4800,9600,115200)

Start with DCF receiver: **DCFGPSvdb.exe port [set [min]]** [Start for demonstration](#)

**port** COM-Port (1...99), deactivate a FIFO if it's activated!

**set** Setting the PC clock after (1...9) correct receptions of the time code.

**min** Set again after having waited for (1...) minutes

Examples:

-- DCF -- 77.5  
kHz

**DCFGPSvdb 1** COM port 1, display of the time, not setting the internal clock, endless

**DCFGPSvdb 3,2** COM port 3, set clock after receiving the time signal two times correctly, end the program

**DCFGPSvdb 1,3,10** COM port 1, set clock after receiving the time signal three times correctly, set again after ten minutes, endless

--GPS--

NMEA-0183

**DCFGPSvdb 8 4800** COM port 8, 4800 baud

Headline:

**12.34:56 - 21/1/06 DCF** Correctly received DCF-time and date

**12.34:56 - 21/1/06 GPS** Correctly received GPS-time and date

**sec=?? >> DCF-Clock...** Start of a minute not yet detected

**sec=56 << DCF-Clock...** Start of a minute detected, DCF-seconds are correct

**?Receive? DCF/GPS-Clock...** None reception, is the receiver really connected?

In the window (DCF):

**(0,1)** correct signs for seconds

**(\*)** start of minute detected

**(#)** no reception

**(?)** received wrong information

**(?Parity?)** time/date not correct

Remark: Using WinNT/2000/XP the number of rows within the window can be changed even if DCFGPSvdb is running (menu on the upper left corner **Properties|Layout/Rows** ).

See the necessary connections between DCF receiver and a 9/25-SUB-D connector of the serial interface in the next picture.

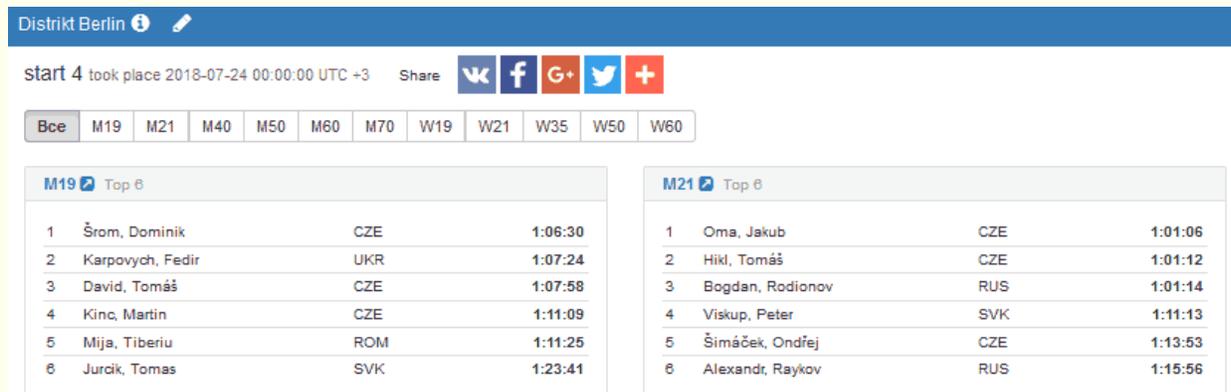

## Results on ORGEO.RU

On the Russian server ORGEO.RU there is a web application, with which the results of ARDF and other competitions can be represented. To do this, data of the competition and the participants must be sent to a specific HTTP address in JSON format with keywords defined for this purpose. After activation in FjwW (menu ***Interface|Transmit to Orgeo-Live*** ) and changes in Competition data window (Ctrl+F3) all available data of the competition and the participants are immediately sent to the server and displayed. With every read-out of SI chips, corrections of participant data, this also happens for the data of this participant only, the new results are practically visible at a distance of seconds and the ARDF world can watch.

This could be the example of a competition on the server:

The overview shows all categories of the competition with the first six ranked.

← Entries

In the dialog after menu **Interface | Transmit to Orgeo-Live** in FjwW this URL has to be inserted.

An **example** looks like this: <http://orgeo.ru/online/sv?id=7754&sk=1894f&sub=1&>

This also displays the clickable link address on which the results can be found. <http://orgeo.ru/live/#/7754>

## Transmit results as JSON

The "Interface/Transmit results as JSON" menu can be used to start sending data/results in JSON format. Using the HTTP protocol and POST, the data is written to a specified URL on port 80 or to a directory released in the network.

When the function is started, all available data and results for all participants are sent immediately. The JSON data receive the value **ALL** for the keyword "SOURCE". During the course of the competition, an individual entrant's results will be sent immediately if:

- the chip of a participant is read in the reading station, only times of found foxes that are to be searched for are given, the keyword "SOURCE" is set to **READOUT**
- the chip of a participant is plugged into the beacon or target station and a serial radio or wire connection to the interface SI-B or SI-C from FjwW, the keyword "SOURCE" is set to **BEACON** or **FINISH**
- the data of a participant are changed, KOR dialog (Ctrl+F7)

The placement calculated in FjwW is not sent, it changes with each participant arriving at the Finish with "SOURCE": "READOUT". The calculation of the placement must be implemented in the 'receiving' software.

The data is displayed in the form "KEYWORD": "String", or in the case of pure numbers as "KEYWORD": 1234,,

The JSON data begin with the name *ARDF-FjwW*, followed by the keywords used:

```
ARDF-FjwW= {  
"SOURCE": "ALL" or "READOUT" or "FINISH" or "BEACON" or "UPDATE"  
"CONTEST": "...",  
"DATE": "...",  
"BEGIN": "...",  
"BAND": "...",  
"COMPETITORS": [  

```

```
{
  "FIRSTNAME": "...",
  "NAME": "...",
  "CLUB": "...",
  "CAT": "...",
  "CARDNO": ...,
  "START": "...",
  "FOX1": "...",
  //...next foxes
  "FOX6": "...",
  "FOX": ...,
  "FINISH": "...",
  "RUNTIME": "...",
  "PLACE": ...,
  "STNO": ...
},
{
  //...next competitors
}
]
}
```

## Start signal output

If the start signal is activated **Interface|Start Signal** a beep is issued for the starting of competitors or cyclically before the minute change.

Depending of input values in the dialog there can be signals at different points of time (60,45...1 sec). A first signal is issued before the start time of competitor or minute change. A second one when the competitors start his competition or minute change. The start signal can be amplified and spread via loudspeaker.

The sounds are defined in the dialog after menu **Interface|Start Signal** . The settings are saved to registry.

Default settings are:

- Beep before start: 10, 5, 4, 3, 2, 1 sec about 1500 Hertz, 60 milliseconds
- Beep at the start: about 1000 Hertz, 550 milliseconds

The pitch and the duration can be configured as needed (300..3000 Hz, 10..3000ms) (see below).

Additionally a start signal can be configured regardless of the starting signals of the competitors (every 1,2,3,5,10 min). This signal automatically starts, when the competition starts.

Start signals for competitors are only activated at the competition day. Changes only take effect for the start signal after the next minute change.

Entries not preceded by an asterisk **\*** are treated as WAV files. If not drive and/or directory is indicated the files have to be located in the same directory as FjwW. The sound files are played instead of the beeps.

## Examples for INI file

~~;- Start signal 60,30,10,5,4,3,2,1 sec before the start  
;- without entry it's at 10,5,4,3,2,1 sec before the start, possible  
60,45...1 sec~~

~~startBeepBefore=60,30,10,5,4,3,2,1~~

~~;- Output to serial port COM1, 1666Hz 77ms~~

~~startBeep1=\*1666,77,1~~

~~;- Output the PC loudspeaker, 1500Hz66ms~~

~~startBeep1=\*1500,66~~

~~;- Output to WAV sound output, declared WAV file~~

~~startBeep1=C:\WINNT\Media\Utopia-Default.WAV~~

~~;- Start signal issued at the start time~~

~~;- Output to serial port COM1, 1000Hz 555ms~~

~~startBeepL=\*1000,555,2~~

~~;- Output the PC loudspeaker, 825Hz333ms~~

~~startBeepL=\*825,333~~

~~;- Output of a declared WAV file to the WAV output~~

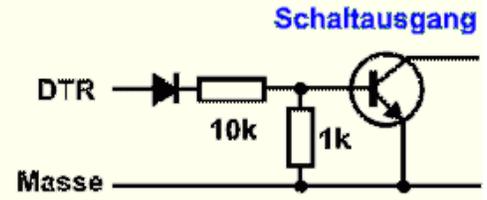

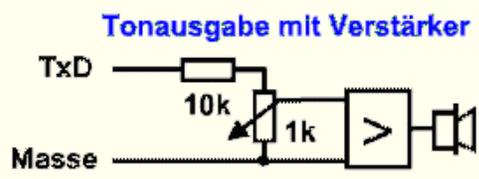

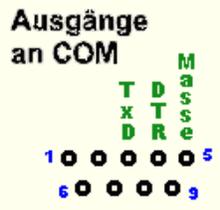

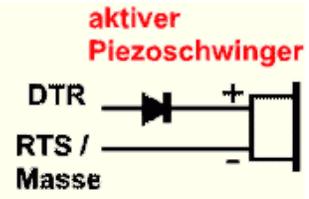

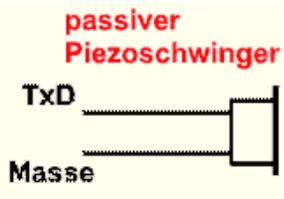

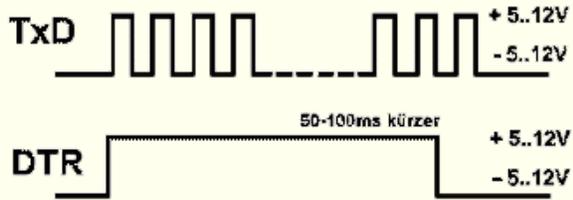

~~;- The file must be located in the FjwW directory~~

~~startBeepL=Utopia-Asterisk.WAV~~

'COM port' creates a signal at the TxD output. As the interface delivers a voltages of -15..5V and +5..15V a passive piezo speaker can be connected directly to the outlet. Using an amplifier requires a limiting of the input voltages!

In parallel to the TxD signal the DTR output is activated and set to high (+5..15V). This voltage can be used to activate an "active piezo" provide it has an internal tone generator. The DTR signal is deactivated about 0,05 and 0,1 seconds than the TxD signal.

The following picture shows the output using the serial interface and the ways how to use the signals.

# Speech output

With this version of FjwW the following speech output is implemented:

- announcement of the next competitors of all loaded competitions which have the same competition date than the actual date. The announcement can be configured as being done 1..9 minutes before the start of the competitors
- announcement of the results of the competitor after reading his SI chip. If the SI chip is not inserted for a sufficient long period this is also announced.
- announcement of the fact that a SI chip is a borrowed one in order to collect them easily.
- announcement of name, first name and call of the competitor marked in the result list.

The installation of the speech-output-software is required (**TextToSpeech**). How the software has to be installed is described later. If the FjwW detects usable TTS they are displayed in the center of the window dialog and can be selected. Pressing **Announce text above here** the text written in the dialog box is read aloud. The volume, pitch and speed can be set with the controls.

To improve the pronunciation for special words an adaptation is required. For this purpose a special pronunciation dictionary can be used. The file indicated at the **TTSpronFile=** statement is used. A sample file called **FjwW\_TTSdeu.txt** is shipped together with FjwW. This file can be used together with *TTS3000* from *Lernout&Hauspie*.

To gain attention a signal can be activated before each speech output (about 1500Hz, 60ms). A ongoing speech output is immediately interrupted if the next one arrives.

## Installation

Prerequisite for the installation of the speech output software is a soundcard and a PC with sufficient power.

Different Text-To-Speech machines (TTS) can be download free and without registration (2016) or by purchase on internet page:

[\*\*Free Text to Speech Natural Voices - SAPI4 & SAPI5 Text-To-Speech Software Features\*\*](#)

Depending on the operating system the installation can be complicated.

The lines in **bold** represent the minimum to be installed to use the speech output in German language. The files have to be downloaded and started. The installation runs automatically after the confirmation of the licence agreements has been done.

[www.microsoft.com/msagent/support/user/tts3000deploy.aspx](http://www.microsoft.com/msagent/support/user/tts3000deploy.aspx)

see above!

for MS-Agent und TTS3000 : -> GERMAN page with more  
information: [www.roeselhof.de/INFO/intro.htm](http://www.roeselhof.de/INFO/intro.htm)

Independent of language of TTS machine, the machine will be  
always receive texts in language, which is adjusted in FjwW  
(German, English, Dutch, Czech, ...). The speech output can be  
impossible to understand.

## Result evaluation offline

The result evaluation and printing of lists can be done at any time after a competition has ended. The TLN/KOR/DAT files have to be loaded. Only the TLN file has to be indicated for the case the KOR/DAT files have the same name and are located in the same directory and the automatic load is activated by

***File|Options|Data to TLN read autom. .***

After loading the files all lists can be printed via the ***Results|...*** menu.

If more than one competition is loaded these can be used for multi competition results evaluation.

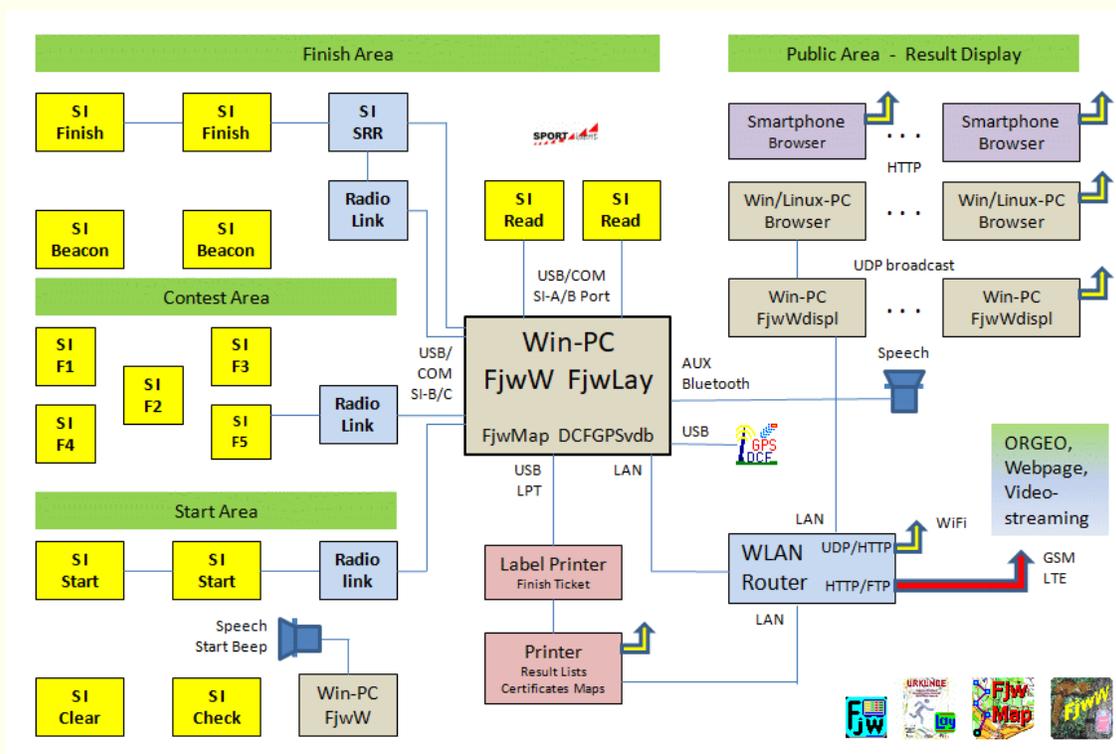

## Supported SportIdent devices and chip cards

<b>SI-Card 5</b>	30 fox time stamps
<b>SI-Card 6</b>	64 fox time stamps
<b>SI-Card 8/9/pCard</b>	30 / 50 / 20 fox time stamps
<b>tCard</b>	25 time stamps (Read station have to be in mode 'Extended protocol') The circulating memory function is not supported, the card must be deleted before reaching 25 time stamps !
<b>SI-Card 10/11/SIAC</b>	64 fox time stamps, the possible 128 fox time stamps are not usable !
<b>BSF/M 6</b>	Control stations ( <b>unsuitable</b> for Slcard 8/9/10/11/SIAC !!!)
<b>BSM 7/8</b>	Master station in modi: Normal / Extended protocol / Autosend Precondition: firmware <b>&gt;= V5.80</b>
<b>BSM 7/8 - USB</b>	Master station in modi: Normal / Extended protocol / Autosend
<b>BSF 7/8/9</b>	Control stations in modi: Normal / Extended protocol / Autosend

The **SI-Card 5** returns only unique 12-hour time stamps. Therefore, the competition begin time will be used to recalculate.

The **SI-Cards >=6** provides unique 4-week time stamps. FjwW is used the 1-week(7-days)-time stamp thereof. Thus, the time stamp can be identified with these SI cards must be deleted no later than 7 days after the first time stamp on the card.

## Hard- and software components

**FjwW** The FjwW program makes the entire evaluation of the competition, generates the various lists of results for printing, for the Internet and for display at the finish on PCs and smartphones.

### FjwLay

The FjwLay program is used to print the certificates according to the competition results. In preparation, a layout is created for printing. Finish tickets can also be printed using FjwLay with significantly expanded graphic options.

### FjwMap

The FjwMap program is used to plan the locations of the transmitters in the area on a suitable (Orienteering) map. It then provides the locations for FjwW.

### FjwWdispl

The program FjwWdispl is used to display the results, which are sent cyclically by FjwW, on PCs.

## **DCFGPSvdb**

Serves to receive the exact time from the DCF time signal transmitter (77.5 kHz) or the GPS satellites (approx. 1.1 - 1.5 GHz) for setting the time in the FjwW PC. The exact time is especially required when programming the SportIdent stations.

## **SI Clear, Check**

When having a lot of competitors it might be necessary to use more than one station to CLEAR the SI chips. The erasing process takes some seconds. The CHECK station is not required when using SI stations BSF6 or newer with firmware V4.x or newer. In this case the CLEAR station also does the check.

## **SI Start, Finish**

As the finish time is registered when the SI chip is inserted into the station there should be enough stations depending on the number of competitors to avoid jams and injustices at the finish line. This may also apply to the starting station(s). If there is a radio link connection, they are connected to the SI-B or SI-C COM ports.

## **SI Read**

Read out the SI card, so that the evaluation takes place immediately. The reading stations are connected to the SI-A or SI-B COM ports.

## **Speech, Start beep**

In large/important competitions, the start and finish are always spatially separated. A second PC can be set up there, where the same competition (TLN, KOR) is loaded in FjwW. With this, announcements can be made in the start area with appropriate loudspeakers/amplifiers about the next starting participants and/or start beeps can be given in the last minute before the start (seconds can be set in FjwW).

## **Radio Link**

A radio link that is able to transparently transmit the serial data of the SI stations with baud rates of 38400/4800 in the direction of FjwW. They are connected to the SI-B or SI-C COM ports.

## **WLAN Router**

To ensure that FTP uploads from FjwW to the Internet and HTTP access to FjwW by guests in the public area are possible with functioning DNS name resolution:

- **FjwW-PC:** Set 'DNS Server' to the router's IP address; If necessary, enable port 80 (HTTP) and 53 (DNS) in the firewall
- **Router:** Set 'Local DNS Server' to the IP address of the FjwW PC (not all routers allow this)

## The INI file

The INI file contains important settings for the program. The settings will be read out after launch of program or of any feature of FjwW. The menu entry **Extras|Save settings** updates the entries in the **[FjwW]** section. Clicking the INI icon in two dialogs will updates the values in sections [FjwW] or [Interface]. The settings of the other sections must be updated manually. The INI file is always located in the same directory as FjwW. A template of the INI file is always shipped with FjwW and writeable.

For many key words in the sections **[FjwW]**, **[Interface]**, **[Edit]**, **[Ticket]**, **[Speech]** there are default values, which are stored in FjwW.exe, when the key word don't exist in the INI file or is a comment line (beginning with semicolon).

The user can create and store several different INI files with any names, in any directories. When the FjwW program is started, the command line option **/i** can be used to load one of the INI file(s) for use during the entire runtime of the program (e.g.

***FjwW.exe /i c:\Test\FjwW1.ini xyz.tln*** ).

**Entries/comments crossed out** below are no longer required and effective, the corresponding information is now stored in the registry under **HKCU\SOFTWARE\FjwW**.

In this section the entries of the INI file will be explained:

### **[FjwW]**

## Example of TLN file

The TLN file can be coded in following formats:

- ANSI (codepage 1252): using until version 7.10 with restriction also since FjwW-Unicode version 8.3.
- UTF-8: required from FjwW-Unicode version 8.3.
- UTF-16: additional possible since FjwW-Unicode version 17.7.

## Explanations:

**@BEGIN(+)** and **@END(+)** are the start and the end of the data part of the file of competitors.

The first 8 lines BEFORE **@BEGIN** are used as headlines for the result lists.

The words beginning with **@** are keywords and cannot be changed. The order of the keywords between **@BEGIN** and **@END** should not be changed.

If a 'a' at the end of times in **@LAST\_FINISH** and **@FIN\_LIMIT\_TIME** that means a time on the day after the date of the competition beginning in **@DATE**.

The line containing **@GRP...STNO...** defines the distances between the columns containing the date of the competitors. The position of the columns and the widths of the columns can be changed freely. The columns start with the beginning of the key word and they end before the start of the next keyword (=column). The order of the keywords can be changed freely (=columns). Keywords which are not needed can be omitted. Additional columns with keywords not used in the example, can be added. These columns are not used by FjwW.

The next line containing **@GRP...** changes the distances between the columns and their order if they are not the same as in the previous one.

The following line with the pseudo ruler **#---|---|...** is meant as a helpline to key in the competitors data. It can be omitted.

Between the columns spaces or tabs should be used as separators. The same separator has to be used in the line containing the keywords.

The keywords marked with (+) are a must within the competitors data line. Lines starting with 'REM' or '#' are ignored. They can be used for comments

### Meaning of the keywords:

#### @GRP

STNO CARDNO NAME, FIRSTNAME CALL BIRTH STAT CAT START SET CLUB

@GRP STNO CARDNO FIRSTNAME NAME  
CALL BIRTH STAT CAT START SET CLUB

**GRP** One to three characters can be used to define the group to which the competitor belongs. This is NOT the category of the competitor! Any combination of four characters and numbers can be used. The group entry is not case sensitive. In the example it's used to distinguish between **W** (women) and **M** (men). While creating the result lists this group indicator can be used for filtering. If there is no entry in the GRP column the competitor will be displayed when using "[ ]" as a filter.

**STNO** (+) Start number of the competitor (1...9999).

This number should only be changed as long as no KOR file has been created. The link between all data sources is this **start number**. KOR files are created if data is modified manually or the raffle of start times is done.

**CARDNO** Chip number used by the competitor. If this number is preceded by an '\*' or '-' the chip is marked as a "lent" one. In this case the chip number is handled different from regular chip numbers.

**NAME, FIRSTNAME** (+) Start with the surname followed the first name, delimited by a comma. Also possible: **FIRSTNAME** and **NAME** in two columns. The both entry is limited to a maximum of 24 characters.

**CLUB** Club or country abbreviation (max. 20 characters). For information see the list of [country codes](#).

If using team result(-lists) the field CLUB is the criteria to define a team.

**CALL** Call of the competitor (max. 7 characters).

**BIRTH** Year of birth of the competitor

**STAT** Indicator that a competitor is 'Fuchsmeister'. If he is, a **FM** should be used in this column. The entry is only relevant, as long as the result list should contain the FJ-Diplom-Punkte.

**START** Start time in the format hours:min. This time is always the original start time without taking into account the start deviation.

If the start time entry is present it overwrites the **SET** parameter and any raffling of start times. It has always the highest priority unless the **@STT\_IN\_DAT** is used (see below).

If a 'a' at the end of times in **@START** that means a time on the day after the date of the competition beginning in **@DATE**.

**CAT** Category of the competitor (max. characters). The first character **MUST** be a character and not a number (see also **@FOX\_LIST**). The category entry is not case sensitive. If no evaluation based on categories is done this column can remain empty.

**SET** Used to set the order while raffling the start sequence (see **START\_BALLOT**). A competitor with a lower **SET** number will start before another competitor within the same category. Numbers between 1 and 9999 can be used. Numbers preceded by an '\*' or '-' the start group of the competitor:

Examples:

\*1 (or -1) forces the competitor to start in the first starting group

\* 9 (or -9) forces the competitor to start in the ninth starting group

Priorities and order when raffling the start groups:

1. Time indicated by the **START** entry
2. Start group defined by **SET** values with '\*' or '!'.  
3. Number of competitors per category and start group has been reached or is exceeded.
4. The competitor having a **SET**-value, which is the lowest within the remaining values.
5. A competitor without any **SET** value

**REM** Comment for this line

**@BEGIN:** (+) Text preceding this keyword is used as header lines in the results list (up to eight!).

**@LIMIT:** Maximum time for each competitor (must be below 500 minutes). If 0 is used no time limit does exist.

**@FIN\_LIMIT\_TIME:** When finish time of competitor exceed this time he/she will be set to 'above Limit'

**@DATE:** (+) Date of the competition. Format: dd.mm.yyyy (European format).

**@FOX\_LIST:** List of transmitter numbers to be searched for by the given category.

If no result calculation based on categories is used (no class results) the category "" has to be defined together with all transmitters to be found by everybody. If no transmitter numbers are entered automatically the transmitter numbers 1...Finish-1 are used.

If FOX\_LISTE entries are missing the IARU categories and transmitter numbers are taken.

The order of the category entries is equal to the order used in several result lists.

For a good EDAD file the following categories should be used:

```
- Competitor: WOM, JUN, SEN, OT, VET,
              W14, W16, M14, M16,
              W19, W21, W35, W45, W55, W65,
              M19, M21, M40, M50, M60, M70,
              JUG, ERW,
              "" (no categories)
- Helper:     HLP, HEL
- Organizer:  ORG
```

Helpers are only stored in the FjwW databases and not used. The helpers are only listed within the EDAD file, the result list and the detailed result list.

**@OPTIONS: KK!** If set the categories of the competitors are not taken into account. **FOXO**  
Foxoring competition

**@START\_DELAY:** Start deviation (max. +/-500 min) of the whole competition. When reading the competitors list this time is added to the start time or added to the start time read from the KOR file.

**@FIN\_BEACON:** Number of finish beacon. In different lists the beacon will be show in other way as the foxes.

**@POSITIONS:** Coordinates of the Start/Transmitters/Finish locations. The coordinates are measured in meters starting at a self defined point zero. The figures must be between -9999 and 9999 meters. Coordinates which are in the north or the east of the point zero are positive.

The order of the entries is the order of the transmitter numbers. Each entry consists of two figures, one for the east/west value and one for the north/south value. The values are separated by ':'. The entries (pairs) are separated by ';' or '/'. Example:

```
startX:startY;fox1X:fox1Y;fox2X:fox2Y; ... foxnX:foxnY;zielX:zielY
```

The '/' delimits Start/Foxes/Finish. The ':' delimits the X- and Y-coordinates.

Transmitters not used in the **@FOX\_LIST** are entered as '0:0/' or even easier as '/'.  
The '0:0/' is used for the start group and the '/' is used for the finish group.

**@CONTEST\_TYP: @CALL\_PROMOTER: @PROMOTER:**

**@PUBLICATION: @CLUB\_PROMOTER: @BAND:**

Are necessary only to create the EDAD file.

**@FINISH\_NO:** (+) The numbers in the **@FOX\_LIST** must be less than this parameter.

**@STT\_IN\_DAT:** If this parameter is used by setting a device/fox number the start time of the competitor will not be the time indicated in the TLN file. It will be taken from the indicated SI station. Start times indicated in the TLN file are deleted.

=127 x Start times will be taken from a start station, rounded up, when x=(1,2,3,5), see above

=1...62 Start times will be taken from a fox station

If a start time was changed manually this start time is kept!

The number from which the start times are taken should not be the finish station or the number of a fox station.

**@FT\_IN\_DAT:** Defines the source of the finish times:

= 0 times from the SI finish station are used (default)

= 1...62 times from the indicated fox station are used

**@SI\_NO\_LIST:** (+) List of SI station numbers, which will be assign to number of foxes; list begin with SI-No for fox1, not existing foxes must filled with SI-No "0".

**@SI-RES\_NO\_LIST:** List of SI station numbers for a second/reserve station, which have not the same number as the first station.

**@FINISH\_LB:** If a light barrier is used and the time recorded after passing the light barrier should be taken as finish time this entry has to be set to 1. Else it must be 0.

**@FIRST\_START:** Time of the day when the first start is done (hh.mm:ss)

**@LAST\_FINISH:** Last time which is accepted to be a valid finish time or time at the transmitter.

**@LOC\_NAMES:** User-defined location names. Replaces the default names set in FjwW.

## Example of CSV file for competitor supplement

The file must have a first line that contains some or all of following key words:

**STNO;CLUB;CAT;NAME;FIRSTNAME;CALL;BIRTH;CARDNO;SET;START;STAT;GRP**

but at least

**CLUB;CAT;NAME**

Also the following German key words are possible

**STNR;DOK;KAT;NAME;VORNAME;CALL;GEBURT;KARTNR;SET;START;STAT;GRP**

(in any order, separated by a semicolon/tabulator). There may be other key words in the line, but the above key words have to appear in the first 20 key words from the beginning the line. The example shows the additional key words **SAVED** and **EMAIL**, they are ignored when reading the file. The competitor data must begin on the line immediately below the keyword line, and the data must be in the same order as the keywords. Both the keywords and data fields must be separated with semicolon/tabulator. Blank lines and comment lines (with '#' starting) are possible after the first line.

Competitors without a starting number will be assigned a number. Starting numbers will be assigned sequentially after the highest existing start number plus 1. The CSV file will be checked for duplicate start, chip numbers, and names. On error the reading will break and no new competitors will be added to the current competition.

If the read in of competitors is successful, the data belonging to competitors in the corresponding KOR file will be read in too.

**STNO;CLUB;CAT;NAME;FIRSTNAME;CALL;BIRTH;CARDNO;SET;START;SAVED;EMAIL**

The character coding of file can be **ANSI**, **UTF-8** or **UTF-16**.

## Example of KOR file

The KOR file (corrections / modifications) is automatically created or data is appended to an existing KOR file on some events. This can be the raffling of the starting order, manual modifications of the data of a competitor or the reading of results from a SI chip in the case a SI reading device is sending them.

A bloc of data always starts with **@SAVE** and ends with **@END**. There can be more than one data block in a single KOR file.

The KOR file is parsed two times.

In the **first parse** the following data is taken into account:

<b>Description</b>	<b>Code</b>
Erase all time data for the given start number	<b>255</b>
Correction of number of transmitters found for a given start number (add info = number of trx)	<b>254</b>
Correction of the start time for a given start number (draw back: add info = 255)	<b>253</b>
Correction of the finish time for a given start number (draw back: add info = 255)	<b>248</b>
Disqualification of a given start number (draw back: add info = 255)	<b>247</b>
Bonus/Credit of a given start number (penalty: add info = 1)	<b>241</b>
Correction of the transmitter time for a given start number (draw back: trx time = 0)	<b>65...126</b>

The data lines have the following format:

**code startNo hrs:min:sec'ms day-month-year  
errorcode; [addinfo;] #comment**

For possible [errorcodes](#) see the related chapter.

In the **second parse** the following data is taken into account:

Attention: The first parse has a higher priority than the second one. If data is found in both parses the one of the first parse will be kept and the data of the second parse is ignored.

Description	Code
Start time for a given start number (obtained by raffling)	<b>252</b>
Correction of the call for a given start number	<b>251</b>
Correction of the club for a given start number	<b>250</b>
Correction of the name for a given start number	<b>249</b>
Set out of competition	<b>246</b>
Erase all raffled start times (start number = 0)	<b>245</b>

The data lines have the following format:

**code startNo hrs:min:sec'ms day-month-year 0;  
@Name/Call/Club/Category #comment**

The time hrs.min:sec'ms is calculated as the middle between the start of competition and end of competition time.

All other data lines have the following format:

**code startNo hrs:min:sec'ms day-month-year  
errorcode; [@ts+/-SHIFT] @idCHIP-NO @siSTATION-  
NO #WeekDay**

Description	Code

Time stamp at the transmitters for a given start number	<b>1..62</b>
Finish time of a Lichtschranke for a given start number	<b>64</b>
Start time for a given start number	<b>127</b>
Finish time for a given start number	<b>128</b>
Time is relative to start time for a given start number	<b>243</b>
Code number of a fox SI station incremented by 1000 for those SI stations which could not be translated into a transmitter number	<b>1020..1254</b>
Code number of a fox SI station or start/finish function number incremented by 2000 The weekday of SI timestamp is not the weekday of competition	<b>2001...2062 2127, 2128</b>
Code number of a fox SI station or start/finish function number incremented by 3000 The station is not suitable with this programming, the data line is commented out	<b>3001...3019 3127, 3128</b>

Since version 19.8, SI-Chip5 (ChipNr < 500000) always has the 12h timestamp (00:00:00 to 11:59:59) in the KOR file unchanged saved! For the classification/placement it will be converted according to the competition begin time.

### Example of a KOR file:

## Example of a Backup-Data-File (DAT)

A backup of an SI readout station was made here. The day of the competition was on Saturday, April 17th, 2021.

The first rows of data come from the Sunday, one of weekend before the day of the competition. They are not effective when reading into FjwW, they are commented out with '#So'.

EDAD files can be checked with the program **EDADcheck** which is shipped with FjwW.

## Example of names list

Several thousand German/foreign participants are registered in the lists of names1/2, collected from hundreds of results from ARDF competitions. This makes it possible to quickly transfer your data to a new competition. The list of names3 contains international referees.

```

```

For the headline with the keywords starting with @ the same rules as for the [TLN file](#); apply. English and German [keywords](#) can be used.

Two different formats can be read by FjwW:

- The data as **FIRSTNAME** or **CALL** start at a fixed position and are filled with spaces until the next data column starts. The first name column starts at the position of the “F” in first name and end just before the “C” of the column for the calls.
- The data as **NAME** or **FIRSTNAME** are separated by tabs.

The **REM** is for free text. The whole line should not exceed 256 characters.

In the **window for competitor data** only the first 80 characters are displayed.

A normal TLN file or a CSV list of individual ratings generated in FjwW (with option: **CSV keyword row 'as TLN'**) can also be imported as a list of names. Several name lists can be loaded at once or added one after the other.

Examples:

- The usual TLN file
- A CSV list for individual ranking with following options: **CSV keyword row 'as TLN'**

## Example files

The following files can be found in the "Examples" subdirectory of FjwW\_uni:

<b>TLN files</b>	
_default.tln	Simple TLN file with explanation of the key words, no participants
_WC2016m80+2.tln	World Championships 2016 Bulgaria, 80- and 2-m-band
_beispiel1.rtf	TLN file in RTF format, can be imported into FjwW via the clipboard
_beispiel2.xls	TLN file in XLS format, can be imported into FjwW via the clipboard
<b>Competitions</b>	
_beispiel.tln (*.kor)	German ranking run 2004, German keywords
_example.tln (*.kor)	German ranking run 2004, English keywords
_wc060916-80m.tln (*.kor)	World Championships 2006 Bulgaria
_beispiel-WC2010m80+2.tln (*.kor)	World Championships 2010 Croatia
_110908sprint.tln (*.kor)	IARU R1 Championships 2011, Sprint competition
_demo.tln (*.kor)	Can be loaded in a non-licensed FjwW version, Comp. <=20, Cat <=2
_wc080904-2m.xls (*.kor)	World Championships 2008 Korea, TLN as EXCEL, import

	into FjwW via clipboard
<b>FjwMap</b>	
_ec070915-2m.map (_ec070915.jpg)	IARU R1 Championships Poland 2007
_wc080906-80m.map (*.jpg) _wc080906-80m-StNo185.gpx	World Championships Korea 2008, with running route
_FjwMap-Sprint-FoxList.txt	Fox lists for Sprint, importable in FjwMap
_FjwMap-Garmin-CSV.csv	Import of locations from a GARMIN CSV file
<b>FjwLay</b>	
_certificate-DM2007.lay (*.jpg) _beisp-urkunde.csv	Layout for certificate printing with FjwLay with data source
_beisp-urkunde.rtf (*.csv)	WORD document for series printing of certificates
<b>Anmeldung mit EXCEL</b>	
_IARU-WC-2022-SRB-Registry.xlsm	Proposal for World Championships 2022, improved VBS macros
_IARU-R1-2021-BUL-Registry.xlsm	Used at the IARU R1 Championships 2021 Bulgaria
_EuroCup-2021-BUL-Registry.xlsm	Used at EuroCup 2021 Bulgaria
<b>Ergebnisse mit EXCEL</b>	
_Ergebnisse_mit_EXCEL_ger.xlsm	Evaluation of small competitions
<b>Verschiedenes</b>	
_ExcelAllSheetsOutAsCSV.vbs	VBS macro for EXCEL: output of all pages as CSV
_FjwWmassIDVprint.vbs	Mass printing of the IDV lists, note the comment in the script

_FjwWregKeyShow.vbs	Show of all existing registry entries for FjwW
_SIstationLabel12.lbl	Label file for 'Brother P-touch Editor' for printing SI station labels

_logo-EYAC.bmp	Results list printing with pictures

## Examples of finish tickets

Name, First name	Club	Call	Cat	CardNo	StartNo
Schmiedeberg, Nils	V24		M21	440244	51
Total runtime / Sequence / Runtimes / Minimal running route					
64:14 min / S-2-3-5-4-1-Z / 12+11+11+14+12+05 min / >8170 m					
Start--Fox--Finish times					
13.25--13.36:36--13.47:11--13.58:22--14.12:28--14.24:15--14.29:14					
28-8-02	1. Ranglistenlauf 2002	Grillenburg	2m		(c) FjwW

If a SI chip is read and the SI number cannot be found in any competition which is loaded the finish ticket is printed in a different way. The differences are:

- No name, club, call, category und competition heading is printed (as they are not available :-)
- Instead of the start number of a competition the start number read from the SI chip is printed
- The start time is the start time read from the SI chip
- In the sequence area the codes of the SI devices is printed instead of the transmitter numbers. They are printed in the order in which they are stored on the SI chip.
- Start and finish time are always printed at the beginning and the end of the sequence list. Because of this negative run times can be calculated as a result.

Name, First name	Club	Call	Cat	CardNo	StartNo
???????????				440244	40244
Total runtime / Sequence / Runtimes / Minimal running route					
64:14 min / S-32-33-35-34-31-Z / 12+11+11+14+12+5 min					
Start--Fox--Finish times					
13.24:45--13.36:36--13.47:11--13.58:22--14.12:28--14.24:15--14.29:14					
28-8-02					(c) FjwW

~~These INI file entries control the appearance of the ticket.~~

~~;;\*\*\* (+1)Running route graphic, (+2)Portrait instead Landscape,  
;; (+4)Station No instead Fox No, (+8)no ticket when unknown SI chip~~

~~tiOption=3~~

~~;;\*\*\* Size of running route graphic~~

~~tiZoomGraphic=4~~

~~;;\*\*\* Font of ticket printing (name, size)~~

~~tiFont=Courier New, 9~~

~~;;\*\*\* margin above in mm~~

~~tiTop=22~~

~~;;\*\*\* margin left in mm~~

~~tiLeft=10~~

~~;;\*\*\* Format head line: (+1)bold, (+2)italic, (+4)underline~~

~~;; add values for several format option~~

~~tiHead=3~~

~~;;\*\*\* Format data line: (+1)bold, (+2)italic, (+4)underline~~

~~tiData=0~~

~~;;\*\*\* Format competition title below: (+1)bold, (+2)italic, (+4)underline~~

~~tiTitl=2~~

~~;;\*\*\* Empty lines after ticket end (default=2)~~

~~tiEndRow=4~~

**The first time ticket printing is activated, a dialog opens in which all settings can be made better.**

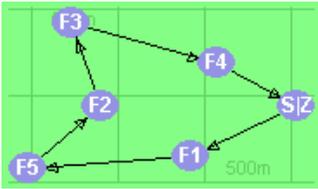

With this new feature, when the dialog is opened for the first time, the corresponding settings are taken from the INI file and saved to the registry with OK, then the INI file information no longer has any meaning.

With this INI file entry, the destination ticket can be printed twice

~~;;\*\*\* Ticket print double, when arrive the finish: (0)no, (1)yes~~

~~tiDouble=0~~

Example in portrait mode:  
with **running route graphic**

Name, Fname	StNo	19	Club

Fox 1	14:47:52	7'04	27'52
Finish	14:51:59	4'07	31'59

Foxes 5, Place 3 at 14:55 o'clock

2.Lauf zur Fränkischen Peilmeisterschaft

---

17.10.2004 (c) FjwW

Foxes 5, Place 3 at 14:55 o'clock	
2.Lauf zur Fränkischen Peilmeisterschaft	
17.10.2004	(c) FjwW

In lines of fox times can be display following characters, they means:

- \* Transmitter was found but is not taken into account because it's not in the list of transmitters to be found by this category
- # Transmitter was found/punched more than one with a time difference > 1 minute
- + The timestamp is out of the range of the start and finish time (must be checked)

It's possible to print tickets quickly with Label-Printer **QL-500 / 550 / 560** of **Brother**.

Name, Vorname	DOK	Call	
Siatek, Daniel	527		
Kat	KartenNr	StartNr	Gesamt-Laufzeit

Intern. Dt. ARDF-Meisterschaft 2005 2=			
www.ARDFF-FjwW.com			

So good-looking finish tickets, also

with graphical elements, are possible.

That required to use the Brother label editor to create a layout file (see \*.lbf in path 'examples' under FjwW-uni) and to install a special FjwW-BrssCom interface. **FjwW-BrssCom** will be delivered by [author](#).

Furthermore the following entries have to write in the INI file under the paragraph **[Ticket]** :

- After the key word **BrotherTicketPrinterName=** the name of label printers have to entered, in the same spelling as find in "Windows Start/Setting/Printers",  
Example: **BrotherTicketPrinterName=Brother QL-560.**
- After the key words **BrotherLabelFilePortrait=** and/or **BrotherLabelFileLandscape=** the name of label file for ticket format Portrait/Landscape have to entered. The file name is relative to path of FjwW-uni

Example:

**BrotherLabelFilePortrait=Examples\\_TicketLabelHochDM.lbl**  
or an absolute file name

Example:

**BrotherLabelFilePortrait=C:\temp\\_TicketLabelHochDM.lbl.**

## Finish ticket with FjwLay

This new form of finish ticket printing offers many opportunities to design a ticket by the user. For this purpose, the program **FjwLay** is used, with which first a special, suitable layout must be created, before printing can be done. Examples are available in the example directory of FjwW. The use of FjwLay provides for the graphic design:

- Selectable size of the ticket
- All fonts, sizes, properties, colors
- Set frames that can be filled with single-line formatted text and keywords
- Setting frames that can be filled with a graphic (JPG/GIF/BMP) preserves the transparent property of the GIF
- Text and graphics in the frame can be aligned, graphics differently adapted to the frame
- Background graphic (JPG/GIF/BMP) over parts or the whole ticket, all other elements printed above it

First of all, the layout is created as it is known from certificate printing. It also uses the familiar keywords in the resulting CSV stream from FjwW to FjwLay:

**Dat, Titl, Cat, Cat3, Nam, Fnam, Clb, Cal, Bnd, Runt, Fo, StNo, ChipN** (English, also German available), see the picture below.

**RunTr, Optm** are new keywords for the minimum route of the participant and the optimal possible route of his category.

A special feature is the block with the keywords **T??a, T??b, T??c, T??d**. Here are the Fox arrival times, including start, finish, difference and cumulative times in search order of foxes listed. The line with **T00?** always shows the start time, the following lines **T01? . . . Tnn?** (nn = max. number of foxes/beacon in the competition) show the fox times. Subsequently, the finish data are given. The lower picture illustrates this.

If the finish ticket is to display the (green) runway graphic in a set frame, the keyword **FjwGIF** must be set. The example below has been designed to be very similar to the well-known original FjwW printable finish ticket, showing the effects of the keywords. Please take a close look at this example, as file **\_Ticket3-enu.lay** it is in the 'Example\Ticket' directory of FjwW.

### Layout in FjwLay

Firstname name	Club	Callsign	
Fnam Nam	Clb	Cal	
Categ.	Chip-No	Start-No	Total runt.
Cat	ChipNo	StNo	Runt
Order	Time	Diff.	Cumulative
T00a	T00b	T00c	T00d
T01a	T01b	T01c	T01d
T02a	T02b	T02c	T02d
T03a	T03b	T03c	T03d
T04a	T04b	T04c	T04d
T05a	T05b	T05c	T05d
T06a	T06b	T06c	T06d
T07a	T07b	T07c	T07d

Course > RunTr m (Optimum Optm m)

FjwGIF

Competition Saxonia 2017

With this type of ticket printing both programs FjwW and FjwLay must be started and set correctly.

In **FjwLay** with **Ticket print from FjwW on/off** the printer to be used must be set and the ticket printing is so activated.

In **FjwW** ticket printing must be activated in menu **Results|Finish ticket/Ticket with FjwLay**.

The data from FjwW are then transmitted to FjwLay via program communication, the keywords are replaced in the layout and printed on the selected printer in FjwLay, **see the right!**

Whether the German or English keywords are sent by FjwW is set by **Results|Options of lists/Key words Language**.

### Printo

Firstname name	C

Course > 7570 m (Optimu

Competition Sax

This example has a paper size of **65 x 115 mm**, suitable for label printers, e.g. of the Brother QL500...

If two tickets are to be printed immediately at the finish, set

Below is another example that shows the new possibilities. Please take a close look at this example, as file **\_Ticket5-enu.lay** it is in the 'Example\Ticket' directory of FjwW. This example has a paper size of A5 (**148 x 219 mm**).

**Layout in FjwLay**

**Printout**

Control	Start	Run	Accum
Start	13:40:00	0'00	
Fox 2	13:50:56	10'56	10'56
Fox 1	13:59:42	8'46	19'42
Fox 3	14:08:30	8'48	28'30
Fox 5	14:13:41	5'11	33'41
Fox 4	14:22:10	8'29	42'10
Beacon	14:28:59	6'49	48'59
Finish	14:29:45	0'46	49'45
Runtime		49'45	min

Both examples above are suitable for a classical competition with 5 foxes and beacon. The following number of **Tnn?** lines are required for the various ARDF competitions:

Classic	<b>T00? ... T07?</b>	Start, 5 Foxes, Beacon, Finish
Sprint	<b>T00? ... T13?</b>	Start, 5 Foxes, Spectator, 5 Foxes, Beacon, Finish
FoxOring	<b>T00? ... T12?</b>	Start, 10 Foxes, Beacon, Finish

## Example for certificate series printing

- **FjwLay** can be used to create a layout for printing diplomas using the results of ARDF competitions. As FjwLay is a standalone application it can be used for many other purposes as well. Examples: Flyers, letters, posters, and so on ...
- The design of the layout is facilitated by using a background graphic (picture of certificate). The data for the printing process can be read from a CSV file (multiple formats are possible), the frame can be placed so exactly.
- One-line texts can be placed in the frames. Keywords are later replaced by data from the control file. Text parts that go beyond the frame do not appear and will not be printed.
- The frames can also take pictures, JPG/GIF/BMP formats are possible. The images are displayed/printed in original size or the size of the frame.
- The printing of diplomas can be initiated within FjwW. According to used option in FjwW it will be write German or English **Key Words** to CSV file. These Key Words have to use also in designed Layout.
- Printing of big amounts of diplomas, single diplomas or the reprint of a whole competition is supported (including printing of the background graphic).
- FjwLay allows the production of finished documents in HTML/CSS format or on server with FPDF created PDF format for publication on the Internet with a first link page to easily reach a single certificate of a particular participant.

The picture at the left shows the final draft of the layout of the diploma. The results of the competition is contained in a CSV file. After loading the CSV file and activation of the preview function the keywords (greyed fields) are replaced by the values from the file. The same happens when printing the diplomas. The result is shown in the picture at the right.

### **[Starting FjwLay with an example](#)**

## Lists with 'User defined columns'

For Start- and Single/Team-Result-Lists (TXT and HTML format) the user is able to influence the look of lists.

Under menu **Results|Options of lists/Single Contest** there is a checkbox **User defined column**.

If enabled, correct key word lines have to exist in the **INI file** under paragraphs **[UserListTXT]** (for TXT lists) and **[UserListHTML]** (for HTML lists).

The INI key words begin with:

**ERG** for Single result lists

**STL** for Start lists

**MAN** for Team result lists

following:

**colTitle** for the title text of columns (TXT & HTML)

**colData** Data key word (uppercase) for displaying value (TXT & HTML), see table below

**colWidth** Width of column in characters, the text will be limit by width or filled with spaces (only TXT)

**colAlign** Alignment key word (uppercase) left, center, right of text within the column (only TXT, in HTML the alignment happen by CSS)

For the six possible lists, there are examples that can modify the user [see INI file](#) .

The entries behind the INI key words must be separated with a slash, the semicolon should nowhere be used.

The title text can also contain other special characters or numbers.

Data key word	Show	CSS class name	max. stringlength	Use in
---------------	------	----------------	-------------------	--------

NAME	Surname	name	24	STL ERG MAN
FIRSTNAME	Firstname	name	24	STL ERG MAN
FULLNAME	'Name, Firstname'	name	24	STL ERG MAN
FIRSTSURNAME	'Firstname Surname'	name	24	STL ERG MAN
SURFIRSTNAME	'Surname Firstname'	name	24	STL ERG MAN
CLUB	Club/Country	clb	20	STL ERG MAN
CALL	Callsign	call	7	STL ERG MAN
CAT	Category	cat	7	STL ERG MAN
STNO	Start No	stnr	4	STL ERG
BIRTH	Birth year	birth	4	STL
START	Start time	time	8	STL
STARTDATE	Date & Start time	time	14	STL
RUNINFO	Current/finally run time of competitor	runT	10	ERG
FINISH	Finish time	time	8	ERG MAN

CARDNO	SI Chip No	Slno	7	STL
STAT	Status	stat	4	ERGMAN
PLACE	Place	pl	3	ERGMAN
RUNTIME	Runtime	time		ERGMAN
GAPTIME	Runtime residue in min:sec	time		ERG
GAPPERCENT	Runtime residue in percent	pts		ERG
FOXNO	Fox number	fox	2	ERGMAN
BONUS	Time bonus	pts		ERG

<b>Align key words</b>				
LEFT	CENTER	RIGHT		

STL - Start lists, ERG - Single rating lists, MAN - Team lists

### Example of Single rating list:

Place	Name	Club	Call	Run time	Fox	RLL
-----						
Category	W21					
1.	Pomplun, Ingrid	N16	DL4YCR	83'47	5	600
2.	Kahmann, Kerstin		SWL	38'19	1	120

With this entries in the INI file under **[UserListTXT]**

**ERGcolTitle**=Place//Name,  
 Firstname/Callsign/Club/Runtime/Fox/RLLpts  
**ERGcolData**=PLACE/SPACES/FULLNAME/CALL/CLUB/RUNTIME/  
 FOXNO/RLLPTS

**ERGcolWidth=5 / 2 / 25 / 6 / 9 / 8 / 4 / 7**  
**ERGcolAlign=RIGHT/LEFT/LEFT/LEFT/LEFT/RIGHT/RIGHT/RIGH**  
**T**

produced the following result list:

Place	Name, Firstname	Callsign	Club	Runtime	Fox	RLPts
-----						
Category	W21					
1.	Pomplun, Ingrid	DL4YCR	N16	83'47	5	600
2.	Kahmann, Kerstin	SWL		38'19	1	120

## Terms of Categories

The official categories defined by the IARU should be used:

**W19, W21, W35, W45, W55, W65**  
**M19, M21, M40, M50, M60, M70**  
**W14, W16, M14, M16** (youngsters)  
**WOM, JUN, SEN, OT, VET** (older IARU rule)

For these categories special graphical icons are displayed in the tool bar.

If others are used, an icons with the first three (of max. 8) characters of category are displayed in the tool bar.

Helpers and organizers must have the category names **HLP**, or **ORG**.

The categories **aK!** (not competitive), **kK!** (no evaluation in categories) and **\$\$\$** (Read in deposite competitors) are reserved.

A **Category alias name** of up to 24 characters can also be specified for each category. This must be entered manually in the TLN file.

This then appears instead of the short name in the result lists (TXT, HTML, CSV).

Examples:

```
@FOX_LIST: "M21" 1 2 3 4 5  
@FOX_LIST: "M21-80m" 1 2 3 4 5  
@FOX_LIST: "M21":"Men of any age" 1 2 3 4 5
```

## Country codes

In the name list FjwW is using the codes defined by the International Olympic committee (**IOC**).

They always consist of a three characters value ([Name list](#)):

 <b>ALB</b> Albania	 <b>AUS</b> Australia	 <b>AUT</b> Austria
 <b>BLR</b> Belarus	 <b>BEL</b> Belgium	 <b>BIH</b> Bosnia/Herzeg.
 <b>BUL</b> Bulgaria	 <b>CAN</b> Canada	 <b>CGO</b> Congo

## File names and file extensions

When creating result lists FjwW makes a proposal for the names. They are build with the following rules:

- The name starts with the name of the TLN file **220415m2** (Example containing a date and the band of the competition):
- An appendix is added to the name depending on the type of result list created (**\*-erg, \*-erg1, \*-stl, \*-lzl, \*-srg, \*-man, \*-kpl, \*-rll, \*-pok, \*-linki, \*-???)**)
- The file extension is appended depending on the file type (**\*.tln, \*.kor, \*.dat, \*.txt, \*.htm, \*.rtf, \*.eda, \*.csv, \*.gif**)

File names with e.g. German vowel mutations and other special characters should be avoided.

Fixed names (hard coded):

**FjwWdeu.chm** Help files  
**FjwWenu.chm**  
~~**FjwWfra.chm**~~  
**FjwW.ini** to be located in the same directory as FjwW  
**TLNfile~.bak** TLNfile = Name of the TLN file  
**~FjwW.log** or others like **~FjwW001.log, ~FjwW002.log, ...**  
located in the directory, delivered by Windows or  
choosed by the user

Files created by the HTTP server within the directory (delivered by INI keyword **HTTPpath=** or choosed by th user)

**~FjwW.tmp \$FjwWhttp \$FjwW\*.gif**

If FjwW crashes the related error logs are created within the irectory, delivered by Windows or choosed by the user

**~FjwWcrash.txt ~FjwWcrash.dmp**

## Keywords in EDAD files

In the table below you will find a short description of the keywords used in EDAD files (V2.4).

The full list of all keywords can be found at the following link (in German):

[www.dl7vdb.de/download/EDADv2.4.pdf](http://www.dl7vdb.de/download/EDADv2.4.pdf)

Using **EDADcheck** the descriptions can be displayed by using the following syntax:

**EDADCHECK.exe /keyword.**

<b><u>00x-</u> <u>02x</u></b>	General information	<b><u>3xx</u></b>	Additional time information

## Keywords

If FjwW working in the German language version, the German key words will be write to the files (TLN, CSV files, lists of names), in any language other as German the English key words will be used.

Regardless of language, the TLN files and Nameslists with German or English key words will be correctly read in. If these files are handled manually, German and English key words must not mixed.

### **TLN file (German keywords) [look here](#)**

## Short cuts

Shortcuts are available in the dialogs and windows. By pressing **ALT+underlined character** the options or fields are directly accessible. Since Windows 2000 by default the underlined characters become visible after pressing the **ALT key**. This can be changed in the control panel settings.

After installation FjwW can be started easy by pressing **Ctrl+Alt+F**. Also the environment variable "PATH" will be extended by directory of installed FjwW, so FjwW can be started on command line easy with "FjwW.exe ..." (without leading path).

Other Shortcuts are available!

### Usable within the activated windows of FjwW

<b>F1</b>	Help for FjwW or the present dialog
<b>Shift+F1</b>	Contextual help about the data field which has the focus
<b>F5</b>	Refresh the result list in the main window
<b>Ctrl+F2</b>	Competition data window to the top
<b>Ctrl+F3</b>	SI status window to the top
<b>Ctrl+F4</b>	Registration window to the top
<b>Ctrl+F5</b>	Edit window to the top
<b>Ctrl+F6</b>	HTML window to the top
<b>Ctrl+F7</b>	Modify the data of the marked competitor
<b>Ctrl+T</b>	Open finish timekeeping window for the activated competition
<b>Ctrl+M</b>	Open multi result list creation
<b>Ctrl+Shift+1...9</b>	Jump to competition 1...9 (if more than one is loaded!)

<b>Ctrl+X</b>	Speech output
<b>Ctrl+Y</b>	DCF/GPS Synchronization
<b>Ctrl+Z</b>	Display arrival list (those who have read out the SI chip)
<b>Ctrl+Ins</b>	Add competitor/helper
<b>Ctrl+Del</b>	Foxhunter/Helper move to deposit

### **Usable within the editor**

<b>Ctrl+A</b>	Select All
<b>Ctrl+C, Ctrl+Ins</b>	Copy
<b>Ctrl+F</b>	Find
<b>Ctrl+N</b>	New file
<b>Ctrl+O</b>	Open file
<b>Ctrl+P</b>	Print
<b>Ctrl+R</b>	Replace
<b>Ctrl+S</b>	Save
<b>Ctrl+Shift+S</b>	Save as
<b>Ctrl+V, Shift+Ins</b>	Paste
<b>Ctrl+X, Shift+Del</b>	Cut
<b>Ctrl+Z</b>	Undo last action

## Fox lists

For each category a Fox list has to be created.

The foxes to be sought and evaluated by the participants of this category are to be listed in any order as numbers 1...62. At the same time this means that these foxes can be searched and registered in any order by the competitors.

A **Start alley** designation may precede the fox list. The designations "A: " to "Z: " are possible. Fox lists could look like this:

A: 1 2 3 4 5  
 B: 1 2 4 5

By using the exclamation mark "!" according to the fox numbers, an order of searching can be prescribed. But then the order of the listed fox numbers plays an essential role. If this order is not followed by the competitor, a red background marker appears in the main window in the column 'Sequence'. However, no automatic evaluation of a wrong order is made.

Start	Finish	Chip No	Sequence	Cat
10:16	10:40:31	7210455	S-2-1-3-5-1F-5F-3F-4F-B-F	M40
9:58	10:27:44	7621109	S-2-3-5-S!-1F-3F-5F-4F-B-F	M40

There is no rule for it. The operator can but by manual correction of the number of fox found the rating and make the resulting placement.

The following examples give an overview of the possibilities:

1 2 3 4 5 - any search order of all; default for ARDF  
 1 2 3! 4 5 - first F1,F2 in any search order, then F3, then F4,F5 in any search order; default for SPRINT  
 1! 2 3 4 5 - first F1, then F2,F3,F4,F5 in any search order  
 1! 2 3 4 5! - first F1, then F2,F3,F4 in any search order, last F5  
 1! 2! 3! 4! 5! - only in search order F1,F2,F3,F4,F5  
 1! 2 3! 4 5! - only in search order F1,F2,F3,F4,F5

In China there is a special rating, if a fox that is not to be searched for is stamped anyway, then the number of foxes found is **reduced by one**.

In the fox list this is indicated by a "%" after the fox number. Example:

1 2 3 4% 5 - Stamping Fuchs 4 leads to reduction

## End-user licence agreement

The software supplied with this agreement is not selling but only licensed. It is only available for using in following terms. Please read this agreement exactly. With installing, copying and downloading or other using of this software you accept the terms of this agreement.

The program **FjwW** is allowed to using for recording and analyzing of sports events from Amateur Radio Direction Finding (ARDF) at special licensed PC. If it is necessary to use the program at further PC at the same event and for preparation and aftercare, it is possible to buy further licences or a license with SportIdent® chip. Delivered further programs like **FjwWdispl**, **FjwMap**, **FjwLay**, **DCFGPSvdb**, **EDADcheck** may used at PC of any number.

The software is copyrighted and protected by the author. It is not allowed to decompile, disassemble, decoding or changing in any way. It is not allowed to sell, rent, license or market in any way the program with all supplied accessories or single parts of it to other without explicit permit of the author.

The software will be supplied at the current developing level and was made with respecting programming determinations. It is indicated, that it is not possible to develop faultless computer programs for all applications. The author is interested in detailed error information and eliminates evident errors if he is able to reproduce them.

The author is not responsible for harms of using the software. Using of the programs is on own risk. At this license agreement can only German law be used.

Handling of the license:

After the start of the program you can see at the field 'PCid' a unique sign sequence. Please send this PCid and for the licensing with SportIdent® chip the chip number to the author. Write the received licence-key into the edit field under this and click **Accept**.

Activate extra at another PC 'SI-Chip Licence' and switch on the activated SportIdent® reading station at serial interface and follow hints at the text you can see.

Without entered valid licence-key the program starts only in a demo version in restricted functions.

## Multiple use of SI chips in a competition

By activating the checkbox **Multi SI-Card** in the 'Competition data Windows' (Ctrl+F3) several competitors can be included in the competition, which use the same chip number, before or during the competition. In the case of a chip shortage, several competitors can successively complete the competition with a identical chip.

**The following details must be observed when this function is activated:**

1. Participants who want/should start with the same chip number can already be present or added to the competition at any time. Initially, these must not have any start times or chip numbers.
2. The start time is assigned **manually** to the first(next) starting competitor. The competitor begins the competition with the chip which is erased.
3. At the finish line, the **finish station must be punched!** The chip is then read out normally, only the competitor with the set start time and not yet available finish time is assigned the read data, if the time of transmitters and finish is after this start time. If the finish station has not been stamped, the finish time of the competitor must be entered manually.
4. If no start time and chip number has been set for this competitor during read-out of the chip, this must be done immediately thereafter, the data of the read chip are automatically fetched from the KOR file. The existing start and finish times are, so to speak, the completion of the use of the chip by this competitor.
5. A repeated readout of the chip shows it as an unknown chip in the SI status window (red oblique stripes).
6. The chip is to **erased** and can be used by the next competitor.
7. Go to item 2.

A chip can only be used successively by several competitors, that is, The start time of a next starting competitor must be later than the target time of a previous competitor. If, inadvertently, an early start

time is manually assigned to the next starting point, time data is already taken from the KOR file of the previous participant to the participant. This mistake can be corrected by **re-entering the correct later start time and deleting the fox/finish times** by activating the checkbox "(Start)/Fox/Finish time delete".

An on-chip start time is not read in any case, thus it is not possible for the competitors with the identical chip number to start with 'stamping the start station'. Possibly at point 4, the start time, which is then visible in the SI status or correction dialog, could be transmitted manually for the competitor.

In the four corners or in the center of the page a graphic can be printed as a background. The size of the graphic can be set in five steps. The value of the transparency can be set continuously. Two examples demonstrate how the graphic is printed in the upper and lower right corners or centered on the page.

## Structure of the name (-field)

In the TLN file and within FjwW the name(-s) of a competitor are always stored as '**Name, Firstname**' or as '**Firstname Name**', the number of the character of names including the separators is limited to 24 characters. In the lists, where the whole name is printed, the same representation is used.

If the name and the first name are needed separately the following rules are applied in order to 'separate' the name from the first name.

- If a comma exists the **Name** ends before the comma. The program assumes that the structure '**Name, Firstname**' was used. The name might include spaces, hyphen and underscore.
- If no comma is found the last part of the string represents the name. The program assumes that the structure '**Firstname Name**' was used. The name might contain hyphens and underscores BUT no space.
- Separators are the space and ;:\*#\$\$%&=|/~". When reading the TLN file and after entering data in the KOR window the separators are automatically removed from the input string.
- Semicolon (;) and number sign (#) will be replaced always by underscore (\_).

### Example:

Completely Name	Name	First name
Schade, Karl-Heinz	Schade	Karl-Heinz
Smith, Charles+Marie	Smith	Charles+Marie
Jens Stein	Stein	Jens
Maier Schulze, Bert	Maier Schulze	Bert
Gertrud Maria Poppel	Poppel	Gertrud Maria
Fritz Schulze-Boysen	Schulze-Boysen	Fritz
Sperling, K. Christian	Sperling	K. Christian

Saleh Al_Sulaimi	Al_Sulaimi	Saleh
**Charly** %W#ieand	W_ieand	Charly

## Team balloting (RUS)

In Russia (SRR, Союз Радиолюбителей России) there is a special way of balloting the starting times. The participants of a team in each category should be started as far as possible. Obviously, it is intended to hinder or prevent possible cooperation between the team members. In each case a random participant of the teams form a starting block, the next block is formed with another random participant from the teams [see](#) .

A team includes the participants who have the same name in the parameter club.

One after the other is done for each category:

- The order of the teams will ballote.
- From each team in the above order one participant is selected randomly, they form the first starting block.
- This is repeated for the next start blocks until all participants in the category are set one after the other.  
If the team does not have another participant not yet selected, the next team will be transferred.
- Participants will be assigned a start time with the first start time and interval selected in the dialog.

More details [see](#) .

## The Ballot starting order concerning IARU-R1

The following excerpts from the current rules of the IARU-R1-ARDF-Working Group show conditions of balloting the starting order at World-/Region1-/EYAC competitions. They are implemented in FjwW.

### **ARDF RULES — Part B / 2015 — valid from January 1st, 2015**

#### **Pg4 17. Starting order**

**17.5** The starting order shall be drawn at random. The draw shall be made in three starting groups (early, middle, late).

**17.6** Competitors from the same society and category may not start at the same time or consecutively. If they are drawn to start consecutively, the next competitor shall be inserted between them.

**17.7** The competitors within one category start at equal start intervals. The normal start interval is 5 minutes.

### **MINUTES 37th Plenary Meeting of the IARU Region 1 ARDF Working Group** held at the IARU Region 1 ARDF Championship, Mariánské Lázně, Czech Republic, August 18-21, 2015

**9. ARDF Rules** The chairman of the Sub-Group Rules presented a number of changes to the rules:

**1.** To delete Appendix 5 (start list preparation), including minor resulting changes to 17.3, S2, F17: This change drops the parallel start system, and it allows every competitor to be assigned to the desired starting group.

It is a prerequisite for balloting the starting order that every competitor in the parameter **SET** the number of start-third (1...3) or the start-fifth (1...5, EYAC) is assigned. Do not use the same numbers within the team of a category and country. A team includes max. 3 or 5 (EYAC) competitors.

Following settings have to be made before the balloting:

- Max. Number of participants in each team (of a country and category), which are 3 in the World-/Region1- and 5 in EYAC-Competitions.
- With the two radio button on top, the distribution of the participants should be selected for each category. 'In the first start groups of only' is common, but does not meet the rule 17.7 !
- If the number of participants is in a category of the half of the largest category, the starting interval for this category can be doubled. Thus a more uniform distribution, in the case 'In the first start groups of only' reach through all groups and usually 17.7 justice.

## Example of CSS-Layout file

The CSS-Layout is written between the lines **@BEGIN** and **@END**, this part will be inserted in head of HTML result file or stored as separate layout file (adjustable by

### ***Results|Options of Lists/CSS Layout*** )

The text before **@BEGIN** is comment and will be displaying in dialog window, the text after **@END** remains unnoticed.

This is the CSS Layout **\_\_STANDARD\_\_**

```
Comment possible
@BEGIN
body,.Trenn,.TrennL {background-color:#ffffe0; text-align:center;}
table {border-collapse:collapse; border:outset 1px; margin-left:auto; margin-right:auto;}

## The Relay race

Der Staffellauf ist eine spezielle Form der Team-Wertung. Die Wertung erfolgt folgendermaßen:

### **Relay race**

- All foxes found by the participants of a team (to be searched for according to the category fox list) are added together, but each fox only counts once, even if it was found by several participants. Each participant can search for one or more foxes, this is not controlled by FjwW (determined by the team participants themselves or the organizer).
- The running times (from start to finish) of all participants are added together.
- Within the category, the relay teams are placed based on the total number of foxes and running time achieved.
- If menu **Results|Team Rating|Any Category** is activated, the category of participants is no longer taken into account, only the same club name forms a relay team and the channels to be searched for are all in the fox list **kk!** for 'Not eval in categories'.

### **Any category**

- The team participants can belong to any category.
- The participants have to search for the foxes according to their category fox list.
- As with the team ranking, the placement is based on the sum of the foxes found and the running time of the best participants (can be set in the menu **Results|Options of lists|Single Contest|Team rating-No of competitors** ).

## Relay race according to Chinese rules

### **Chinese Rules**

- The three participants with the same Club name and Category form a relay team and their results are used for the team ranking
- If the teams have to look for a total of six foxes according to their category, each team participant will look for a maximum of two foxes; If there are nine in total, everyone is looking for a maximum of three foxes
- All participants stay at one starting point, separated into three team groups
- The participants in a team start one after the other in a self-determined order
- All team participants who start first start at the same time (mass start)
- After a participant returns to the starting point, he stamps the finish station and informs the next starting team participant about the foxes he has found
- The next participant stamps a starting station and begins his fox search
- . . .
- The participants of third teams run to the finish after their fox search

At the starting point there are one or more start and destination station(s), at the destination there is only one or more destination station(s).

How is it scored:

1. The Chinese rules also recognize 'false foxes' (normally structured transmitter locations, the transmitter is not switched on; marked with '%' in the FjwW fox list); If these are stamped, the number of foxes found is reduced by one
2. Only the first two or three stamped foxes (according to the category) are counted; if there are foxes that are not to be searched for, they are not counted
3. The team's number of foxes is calculated by adding the number of foxes of the participants, but reducing it by the number of foxes the team found multiple times
4. The placement of the teams in the categories is based on the total number of foxes ranked and the total running time of the team members

Which settings need to be made in FjwW:

- Menu **Results|Team rating|Relay race** activate
- Menu **Results|Team rating|Chinese rules** activate (Realization of point 2. above)
- Menu **Results|Options of lists|Single contest|Competitors per team** Set =3 (default =3)
- Menu **Results|Options of lists|Single contest|Rated best competitors** Set =3 (default =2)
- Menu "File|Balloting start times" with 'Mass start' set the start time of the first teams for all participants  
BR> The start times of the second and third teams will later be overwritten by the times from the start station

## Codes

**KORR**codes, which indicate which data of the competitor was manually modified:

- b** starting time was balloted
- s** starting time was manually modified
- z** finish time was manually modified
- f** number of transmitters (foxes) was manually modified
- t** timestamp of a transmitter was manually modified
- d** competitor was disqualified

## Working with multiple result lists

This function can be used after **Results|Multi lists, FTP** to generate several/always the same current result lists/files. The directory used for this is shown below, in which all files are saved. This is done once every time after clicking **Start**.

The specified files can also be uploaded once/cyclically to an FTP server via FTP. To do this, the following four details must be entered: **FTP Server Name, User, Remote Directory, Password**. The four fields are defined by the INI keywords **FTPserverName=**, **FTPuser=**, **FTPpassword=**, **FTPHostPath=** and can be changed. The time for the cyclic upload can be set. With button **Save INI** changed entries are saved in the INI file. The password is encrypted, so it cannot be written manually into the INI.

The two FTP upload options mean:

- With **Auto-Refresh in HTML**, a ' tag' is inserted into the HTML files, which results in an automatic refresh of this page in the clients (Internet browsers) after the specified time
- With **Auto-Scroll in HTML** causes slow scrolling of the page in the clients (Internet browsers)

If an error occurs during the FTP upload, an FTP error is displayed in the status bar on the right in the main window. The dialog can be opened again for further information.

**Please note !** After the files have been created in the specified directory, **all** files in this directory (including other types of files existing there) will be uploaded to the FTP server and, once a file has been successfully uploaded, this file will be deleted immediately !!!.

# Working with multiple instances of FjwW

Up to 32 competitions can be loaded in FjwW, e.g. to generate a cup rating from several competitions.

For example, two or more competitions can be loaded that will take place one after the other, overlapping or in parallel. It is the principle in FjwW that when reading out the participants' chips, the read time stamps are written in **all** KOR files of the loaded competitions **with the current date**. If the competitions are separated by the set competition start and end times, the scoring of the competitions hardly causes any problems.

If the competitions run more or less simultaneously, the read time stamps can also have an impact on another loaded competition, which the operator often does not notice very quickly. Here is the help from working with multiple instances (running FjwW programs). To do this, after starting FjwW for the first time (1st instance), the ***Extras|Several FjwW instances*** menu is called up. Each restart of FjwW or e.g. loading a competition by double-clicking on a TLN file creates another instance (running FjwW program). The started instances are completely separated from each other in Windows, the problem described can no longer occur.

It should be noted, however, that resources in the instance can no longer be shared:

- Each instance must have its own SI reading station if the chips of participants in a running competition are to be read
- Each instance needs its own temporary directory that can hold the various LOG/TLN/FTP/HTTP files that don't interfere with other instances
- Each instance needs its own port address for the HTTP server. This can be set in the INI file with the keyword **HTTPport=** (e.g.

8080, standard 80). Each instance requires its own port addresses for UDP sending to the DisplayPCs. This can be set in the INI file with the keyword **UDPport=** (e.g. 23456, standard 12345).

For the settings to take effect, a separate INI file must be created when starting the FjwW instance with the command line option **/i** (e.g. "FjwW.exe /i c:\temp\ini2.txt ") be handed over.

Mit dem **Ranglistensystem** sollen die besten deutschen Amateurfunkpeiler in jeder Kategorie ermittelt werden. Die Ergebnisse bilden die Grundlage bei der Auswahl von Teilnehmern aus Deutschland für internationale ARDF-Wettbewerbe.

Dazu werden die Deutsche ARDF-Meisterschaft und drei/vier ausgewählte Wettbewerbe herangezogen, die nach IARU-/DARC-Regeln ausgerichtet werden müssen.

- Der beste Läufer mit den meisten Sendern und der kürzesten Laufzeit erhält 100 Punkte pro gefundenem Sender. Jeder danach platzierte Läufer mit gleicher Senderzahl erhält 100 Punkte, abzüglich der prozentual mehr gebrauchten Laufzeit.
- Der erste Läufer mit einem Sendern weniger erhält die Punktzahl des vor ihm Platzierten, abzüglich der ggf. mehr gebrauchten Laufzeit. Bei den weiteren Läufern wird wie oben verfahren.
- Die Gesamtpunktzahl des Läufers ergibt sich aus den oben ermittelten Punkten, multipliziert mit der Zahl der vom Läufer gefundenen Sender.
- Läufer, die die Limitzeit überschreiten oder keinen Sender (ausschließlich Zielbake) gefunden haben, bekommen keine Punkte. Läufer mit mehr als der doppelten Laufzeit des Siegers erhalten keine Punkte.
- Es wird jede Kategorie getrennt gewertet.
- **Seit 2010:** Unabhängig der zu suchenden Senderzahl bei den verschiedenen Wettkämpfen (z.B. Foxoring mit deutlich höherer Senderzahl) wird in allen Kategorien die Punktzahl des Erstplatzierten auf 600 Punkte und der folgenden Platzierten entsprechend in jedem Wettkampf hoch- oder heruntergerechnet.
- ~~**Nicht mehr seit 2013:** In jedem Frequenzband muss mehr als ein Wettkampf absolviert werden, damit die erreichten Punkte zur Gesamtpunktzahl addiert werden~~
- **Seit 2013:** Teilnehmer, die als Ausrichter eines RLL-Wettbewerbs tätig sind, können Ausrichterpunkte als Ausgleich für die entgangenen Teilnehmerpunkte erhalten, siehe weiter unten (\*\*\*)
- **Seit 2018:** Es wird nicht mehr zwischen dem 80- und 2-m-Band unterschieden. Wenn alle Wettbewerbe absolviert sind, werden drei Wettbewerbe mit den kleinsten Punktzahlen gestrichen, also nicht zur Gesamtpunktzahl addiert.

Beispiel: RLL-Punkte in einem Wettbewerb

Platz	Teilnehmer	Laufzeit /min	Punkte	Sender	Gesamt
1.	Runner1	60:00	100	5	500
2.	Runner2	75:00	75	5	375
3.	Runner3	90:00	50	5	250
4.	Runner4	80:00	50	4	200

5.	Runner5	120:00	0	4	0
----	---------	--------	---	---	---

Beispiel: RLL-Punkte über 2\*4 gewerteten Wettbewerbe

Platz	Teilnehmer	2-m-Band					80-m-Band					Gesamt
		#1	#2	#3	#4	Punkte	#1	#2	#3	#4	Punkte	
1.	Runner1	500	400	500	200*	1400	500	300	100*	500	1300	2700
2.	Runner2	-	500	300	400	1200	400	400	300	200*	1100	2300
.??.	Runner3	0	-	200	-	200	-	-	200*	-	0	200

(-) nicht teilgenommen, (\*) Streichergebnis, (") Punkte nur aus einem Wettbewerb

(\*\*\*) Wenn Teilnehmer **Ausrichterpunkte** für ihrer Tätigkeit für den entsprechenden Wettbewerb erhalten sollen, ist folgendermaßen vorzugehen:

- Der Teilnehmer ist 'außer Konkurrenz' zu setzen, ihm also die Kategorie **aK!** zu geben
- Der Teilnehmer ist im Statusfeld auf **AP** zu setzen

Zur Berechnung der Ausrichterpunkte werden die zwei besten Punktzahlen von aktiver Teilnahme bei Ranglisten-Wettbewerben addiert und halbiert den Wettbewerben mit Helfer Funktion zugeordnet.

Hinweis: Da die Teilnehmer, die Ausrichterpunkte erhalten sollen, auch als Helfer erfasst werden (für Erhalt von Fj-Diplompunkten) müssen sie hier mit leicht verändertem Namen erfasst werden (gleiche Namen für Teilnehmer und Helfer sind nicht möglich). Ein Vorschlag wäre aus 'Name, Vorname' z.B: 'Name\_, Vorname' zu machen.

Wenn das Ergebnis einzelner Teilnehmer oder ganzer Kategorien eines Wettbewerbs gestrichen werden sollen, also keine RLL-Punkte bekommen und auch nicht als Streichergebnisse zählen sollen, ist das Statusfeld jedes dieser Teilnehmer mit einem Prozentzeichen **%** zu ergänzen.

## Preparation of SportIdent stations

For a normal ARDF competition the following SI stations are needed:

- **Clear** It's mandatory to erase all prior timestamps from the SI chip by using the clear station! This is essential when using the SI-Card5, which can store only 30 half-day timestamps. From SI-Card6 they store 4-week timestamp, but in FjwW only the weekday information is used, it could be deleted every week or if an overflow of the timestamps to be saved (different for the various SI cards) threatens.
- **Check** To check whether the erase process was successful, this job is also done by clear station.
- **Start** If the start time is not fixed but taken by a timestamp at the start station; If the data of the start station is to be evaluated immediately by FjwW via the interface, it must have the station number=3.
- **Foxes/Beacon** some stations at transmitters/beacon to take the time and do the timestamp. The station have to have numbers 20...254.
- **Finish** The finish timestamp is written to the chip and registered in the station. It's necessary to place enough finish stations at the finish line to avoid jams. If the data of the destination station is to be evaluated immediately by FjwW via the interface, it must have the station number=4.
- **Read** A master station in conjunction with a PC running the FjwW program is able to read the chips and the timestamps on it.

The stations for clear/check/finish can have station numbers within 1...19.

The SI stations have to be prepared before the competition starts. This can be done with the **SI-Config Plus** (obsoletely **SI-Config** and **SIMAN**) software provided as freeware by the producer of the SI stations AES [www.sportident.com](http://www.sportident.com). Some important settings can be

done with the FjwW software (see ***Interface|Stations Service*** ).

In this mode the station have a programmable operating time (for example 6 hours). After switching on the station it will stay on for the programmed time. If a SI chip is registered the time count restarts from zero and the full operating time available again. To check the proper operation of the SI station a SI card should be inserted (beep and flash must appear). This SI chip should not be used within the same competition because the related timestamp is not only stored on the chip but also in the SI station. The chip can be erased before being used but the station can not be erased when it's already brought to the transmitter! Once programmed the operating time is always the same until it's reprogrammed.

~~The operating time has to be big enough to cover the hiding of the transmitters and the time between the first start and the first found of the transmitter. If a station switches off because the operating time has passed it can not be switched on by the competitors if it's a station prior to BSF7! stations of type BSF7 and higher do not require a switch on. They are always in a sleeping mode and become active after a chip is inserted. No magnet is needed for these stations.~~

**FjwW** can also be used for this purpose. Use ***Interface|SportIdent*** . Select the interface, set the first start time to a value equal or greater than the zero time and select ***Read stations via master***. After the communication with the master station is ok (perhaps help to switch it on with OFF chip) use the function "Interface/Station Service" for setting the relevant options for the stations used in the competition.

After being switched on the stations will be on for the operating time which has been set. Each time a SI chip is registered the operating time starts from zero. The stations can be switched off with the **OFF chip** or with SI-Config or FjwW.

The SI station stores the timestamp in its internal memory. The data is not erased when the station is switched off. The data can be read via a master station at any time. To avoid a memory overflow or mistakes created by older timestamps still available in the stations memory it's recommended to clear the memory of the stations used in the competition. This can be done with **SI-Config** or FjwW (see ***Interface | Backup / Display Data*** ).

### **Mapping of SI station numbers to the ARDF transmitters**

The stations should be programmed with the numbers **31...35...** for the transmitters **F1...F5...**. If more than one station is used at one transmitter the stations must have the same number!

But since the FjwW version 10.6 it's possible to assigned a second/backup station number to a fox. This is particularly in the case of failure (of the SI station at the fox) valuable. In the competition data window this number can be entered in addition, the number of the failed station must remain in FjwW get even, because participants may have already been registered at this tation.

Only in case of exceptions other rules can be applied:

- Exception: The stations are moved to another place where the transmitter number should be different but they can not be reprogrammed. In that case the sequence of station numbers must be changed. The first number is the one corresponding to the first transmitter.
- Exception: More than one competition are organized in parallel having a common finish station (for example if 80m and 2m is done in parallel). In this case the station numbers of one competition could be **31...35** and **36...40** for the second. The relation between station number and transmitter number is set up in the TLN file at the **@SI\_NO\_LIST** entry or in the dialog for the competition data within FjwW.

Mode of operation of the reading station:

There are two ways of using the reading stations:

- Interactive mode

The SI reading station must be connected to the serial interface (or the USB port) of the computer running FjwW. The interface must be enabled within FjwW (see ***Interface|SportIdent***). As soon as a SI chip is inserted into the reading station a message is sent to FjwW. The program fetches the data of the SI chip and sends a confirmation to the reading station. This confirmation causes the reading station to store the data as well. In this operation mode the SI chips can only be read if the station is switched-on and connected to the PC and with FjwW running and an enabled interface.

- Autosend mode

As soon as a chip is inserted into the reading station the data of the chip is stored in the memory of the station and sent out regardless of the status of the PC or notebook. The reading station can be used for automatic reading and storage of SI chips when the competitors arrive.

If the SI reading station is connected to a serial or USB interface and the interface is activated by using

***Interface|SportIdent*** the behaviour is alike the interactive mode. If the reading station is not always connected to a running FjwW (so to say the number of read chips within the station is not the same as those received by FjwW), another way has to be chosen to get the data for the result calculation. A backup of the data has to be done via

***Interface|Backup/Display Data***. The resulting DAT file has to be (re)read by FjwW via ***File|DAT Data File read***.

Attention: If the memory limits are reached **all** eldest timestamps are lost !!!
